## Why Look for Another Ligand if You Already Have Some?

Experimental screening generated some ligands, but they don't bind tightly enough

A company wants to work around another company's chemical patents

An high-affinity ligand is toxic, is not well-absorbed, difficult to synthesize etc.

Etc. etc.

# A High-Dimensional “Chemical Space”

Each compound is at a point in an n-dimensional space

Compounds with similar properties are near each other

# Drug properties

# LIPINSKI'S RULE OF FIVE

Lipinski's rule of five states that, in general, an orally active drug has no more than one violation of the following criteria:

- Not more than 5 hydrogen bond donors (nitrogen or oxygen atoms with one or more hydrogen atoms)
- Not more than 10 hydrogen bond acceptors (nitrogen or oxygen atoms)
- A molecular mass less than 500 daltons
- An octanol-water partition coefficient log P not greater than 5

## Rules for drug discovery success

- Set of approved drugs or medicinal chemistry compounds and their targets can be used to derive rules for drug discovery success (or failure):
  - What features make a successful drug target?
  - What features make a protein druggable by small molecules?
  - What features of a compound contribute to good oral bioavailability?
  - What chemical groups may be associated with toxicity?

## PREDICTING FUNCTIONAL DYNAMICS

- Proteins are intrinsically flexible molecules with internal motions that are often intimately coupled to their biochemical function
  - E.g. ligand and substrate binding, conformational activation, allosteric regulation, etc.
- Thus knowledge of dynamics can provide a deeper understanding of the mapping of structure to function
  - Molecular dynamics (MD) and normal mode analysis (NMA) are two major methods for predicting and characterizing molecular motions and their properties

**PHYSICS-BASED** POTENTIALS  
**ENERGY TERMS FROM PHYSICAL THEORY**

$$U(\vec{R}) = \underbrace{\sum_{\text{bonds}} k_i^{\text{bond}} (r_i - r_0)^2}_{U_{\text{bond}}} + \underbrace{\sum_{\text{angles}} k_i^{\text{angle}} (\theta_i - \theta_0)^2}_{U_{\text{angle}}} + \underbrace{\sum_{\text{dihedrals}} k_i^{\text{dihe}} [1 + \cos(n_i \phi_i + \delta_i)]}_{U_{\text{dihedral}}} + \underbrace{\sum_i \sum_{j \neq i} 4\epsilon_{ij} \left[ \left( \frac{\sigma_{ij}}{r_{ij}} \right)^{12} - \left( \frac{\sigma_{ij}}{r_{ij}} \right)^6 \right]}_{U_{\text{nonbond}}} + \sum_i \sum_{j \neq i} \frac{q_i q_j}{\epsilon r_{ij}}$$

- $U_{\text{bond}}$  = oscillations about the equilibrium bond length
- $U_{\text{angle}}$  = oscillations of 3 atoms about an equilibrium bond angle
- $U_{\text{dihedral}}$  = torsional rotation of 4 atoms about a central bond
- $U_{\text{nonbond}}$  = non-bonded energy terms (electrostatics and Lenard-Jones)

CHARMM PE. function, see: <http://www.charmm.org/>

TOTAL POTENTIAL ENERGY

- The total potential energy or enthalpy fully defines the system,  $U$ .
- The forces are the gradients of the energy.
- The energy is a sum of independent terms for: Bond, Bond angles, Torsion angles and non-bonded atom pairs.

$$F(x) = -dU/dx$$

MOVING OVER THE ENERGY SURFACE

- Energy Minimization drops into local minimum.
- Molecular Dynamics uses thermal energy to move smoothly over surface.
- Monte Carlo Moves are random. Accept with probability  $\exp(-\Delta U/kT)$ .

# PHYSICS-ORIENTED APPROACHES

## Weaknesses

- Fully physical detail becomes computationally intractable
- Approximations are unavoidable  
(Quantum effects approximated classically, water may be treated crudely)
- Parameterization still required

## Strengths

- Interpretable, provides guides to design
- Broadly applicable, in principle at least
- Clear pathways to improving accuracy

## Status

- Useful, widely adopted but far from perfect
- Multiple groups working on fewer, better approxs
  - Force fields, quantum entropy, water effects
- Moore's law: hardware improving

**KEY CONCEPT:** POTENTIAL FUNCTIONS DESCRIBE A SYSTEMS **ENERGY** AS A FUNCTION OF ITS **STRUCTURE**

Two main approaches:

- (1). **Physics-Based**
- (2). **Knowledge-Based**

## KNOWLEDGE-BASED DOCKING POTENTIALS

## ENERGY DETERMINES **PROBABILITY** (STABILITY)

Basic idea: Use probability as a proxy for energy

Boltzmann:  

$$p(r) \propto e^{-E(r)/RT}$$

Inverse Boltzmann:  

$$E(r) = -RT \ln[p(r)]$$

Example: ligand carboxylate O to protein histidine N

1. For each structure, histogram the distances from O to every histidine N
2. Sum the histograms over all structures to obtain  $p(r_{O-N})$
3. Compute  $E(r_{O-N})$  from  $p(r_{O-N})$

## KNOWLEDGE-BASED DOCKING POTENTIALS

“PMF”, Muegge & Martin, J. Med. Chem. (1999) 42:791

A few types of atom pairs, out of several hundred total

$$E_{prot-lig} = E_{vdw} + \sum_{pairs (ij)} E_{type(ij)}(r_{ij})$$

## KNOWLEDGE-BASED POTENTIALS

### Weaknesses

Accuracy limited by availability of data

### Strengths

Relatively easy to implement  
Computationally fast

### Status

Useful, far from perfect  
May be at point of diminishing returns  
(not always clear how to make improvements)

## MD Prediction of Functional Motions

Accelerated MD simulation of  
nucleotide-free transducin alpha subunit

Yao and Grant, Biophys J. (2013)

“open”

## COARSE GRAINING: **NORMAL MODE ANALYSIS** (NMA)

- MD is still time-consuming for large systems
- Elastic network model NMA (ENM-NMA) is an example of a lower resolution approach that finishes in seconds even for large systems.

Atomistic

C. G.

Coarse Grained

- 1 bead /  
1 amino acid
- Connected by  
springs

NMA models the protein as a network of elastic strings
