“Bioinformatics is the application of computers to the collection, archiving, organization, and analysis of biological data.”

... A hybrid of biology and computer science

“Bioinformatics is the application of computers to the collection, archiving, organization, and analysis of biological data.”

Bioinformatics is computer aided biology!

“Bioinformatics is the application of computers to the collection, archiving, organization, and analysis of biological data.”

Bioinformatics is computer aided biology!

Goal: Data to Knowledge

So what is **structural bioinformatics**?

So what is **structural bioinformatics**?

... computer aided structural biology!

Aims to characterize and interpret biomolecules and their assemblies at the molecular & atomic level

Why should we care?

Why should we care?

Because biomolecules are “nature’s robots”

... and because it is only by coiling into **specific 3D structures** that they are able to perform their functions

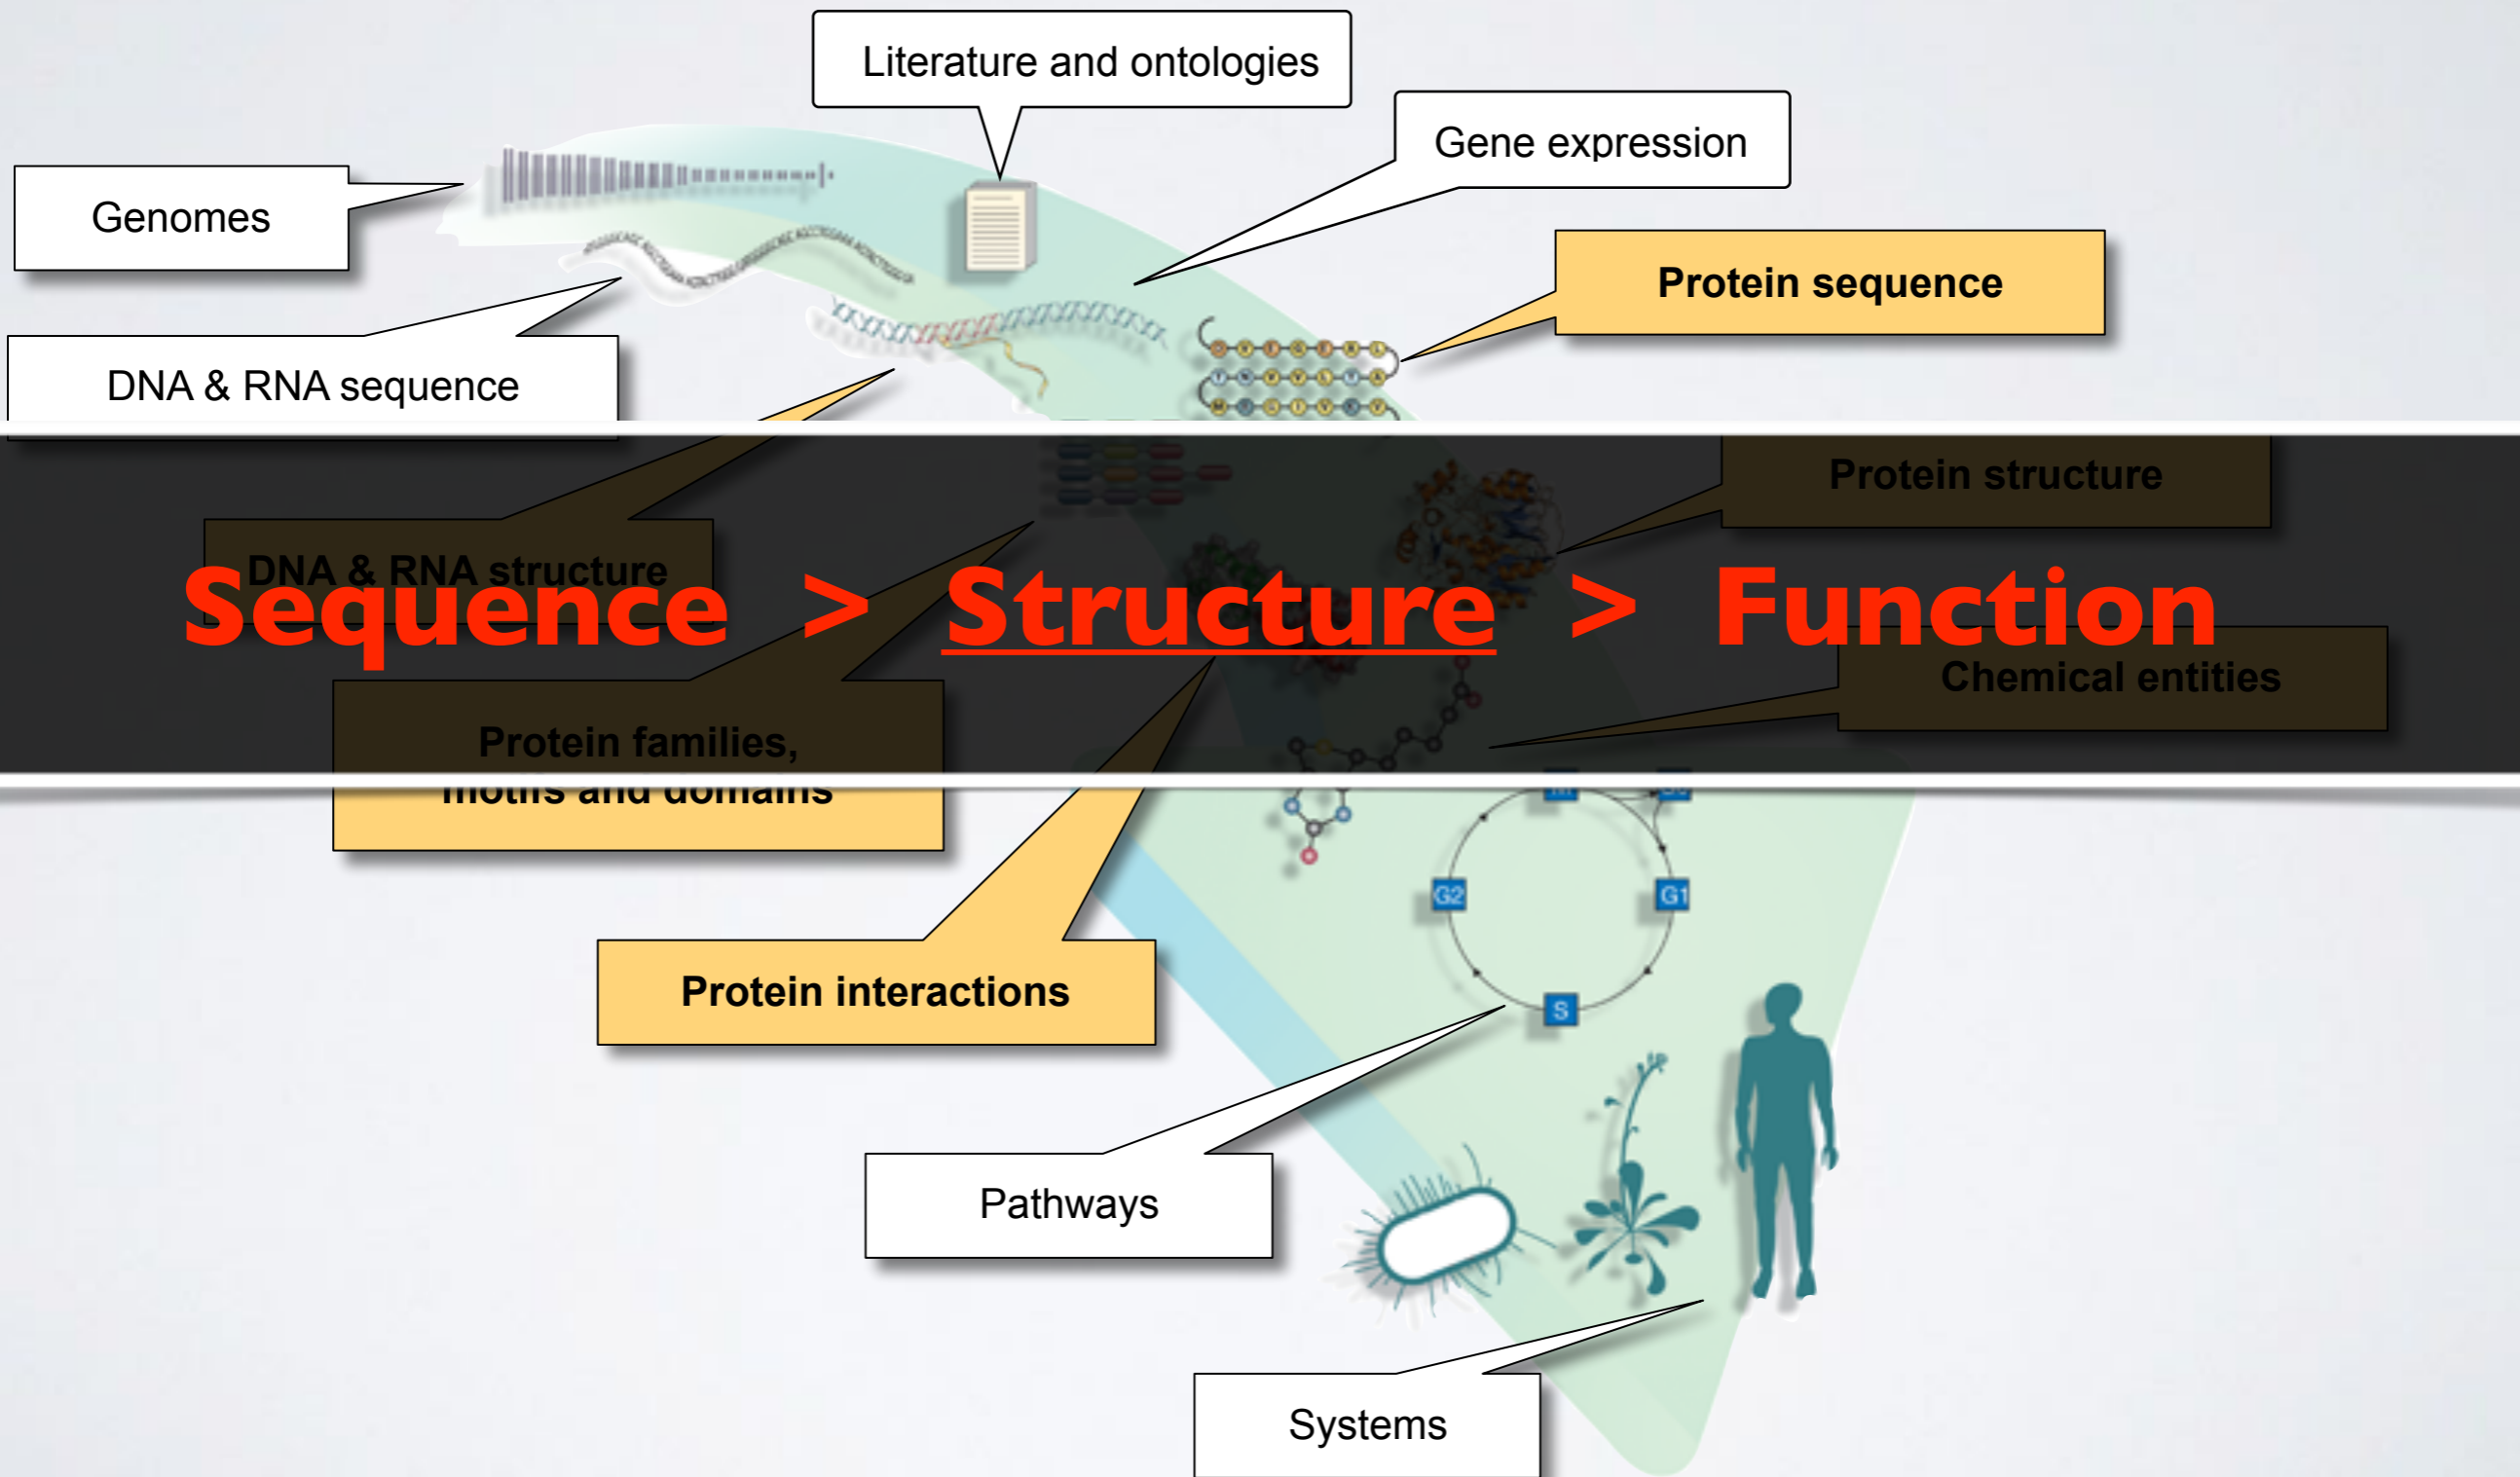

BIOINFORMATICS DATA

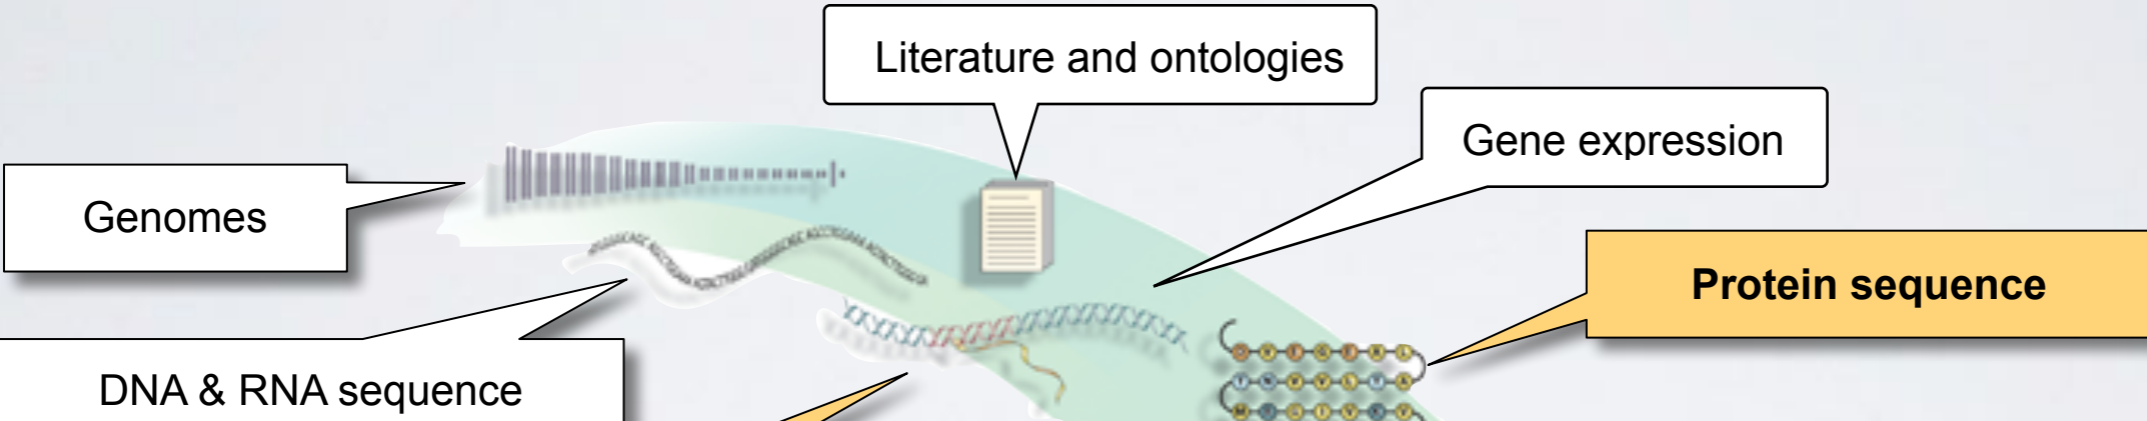

STRUCTURAL DATA IS CENTRAL

STRUCTURAL DATA IS CENTRAL

STRUCTURAL DATA IS CENTRAL

Sequence

- Unfolded chain of amino acid chain
- Highly mobile
- Inactive

Structure

- Ordered in a precise 3D arrangement
- Stable but dynamic

Function

- Active in specific "conformations"
- Specific associations & precise reactions

In daily life, we use machines with functional *structure* and *moving parts*

Genomics is a great start

Track Bike – DL 175

31	145933	Track Sprocket, Specify 12, 13, 14, 15, or 16 T.

- But a parts list is not enough to understand how a bicycle works

... but not the end

- We want the full spatiotemporal picture, and an ability to control it
- Broad applications, including drug design, medical diagnostics, chemical manufacturing, and energy

TRADITIONAL FOCUS **PROTEIN, DNA**
AND **SMALL MOLECULE** DATA SETS
WITH **MOLECULAR STRUCTURE**

Protein
(PDB)

DNA
(NDB)

Small Molecules
(CCDB)

Motivation 1:
Detailed understanding of
molecular interactions

Provides an invaluable structural
context for conservation and
mechanistic analysis leading to
functional insight.

Motivation 1:

Detailed understanding of molecular interactions

Computational modeling can provide detailed insight into functional interactions, their regulation and potential consequences of perturbation.

Motivation 2:

Lots of structural data is becoming available

Structural Genomics has contributed to driving down the cost and time required for structural determination

Data from: <http://www.rcsb.org/pdb/statistics/>

Motivation 2:

Lots of structural data is becoming available

Structural Genomics has contributed to driving down the cost and time required for structural determination

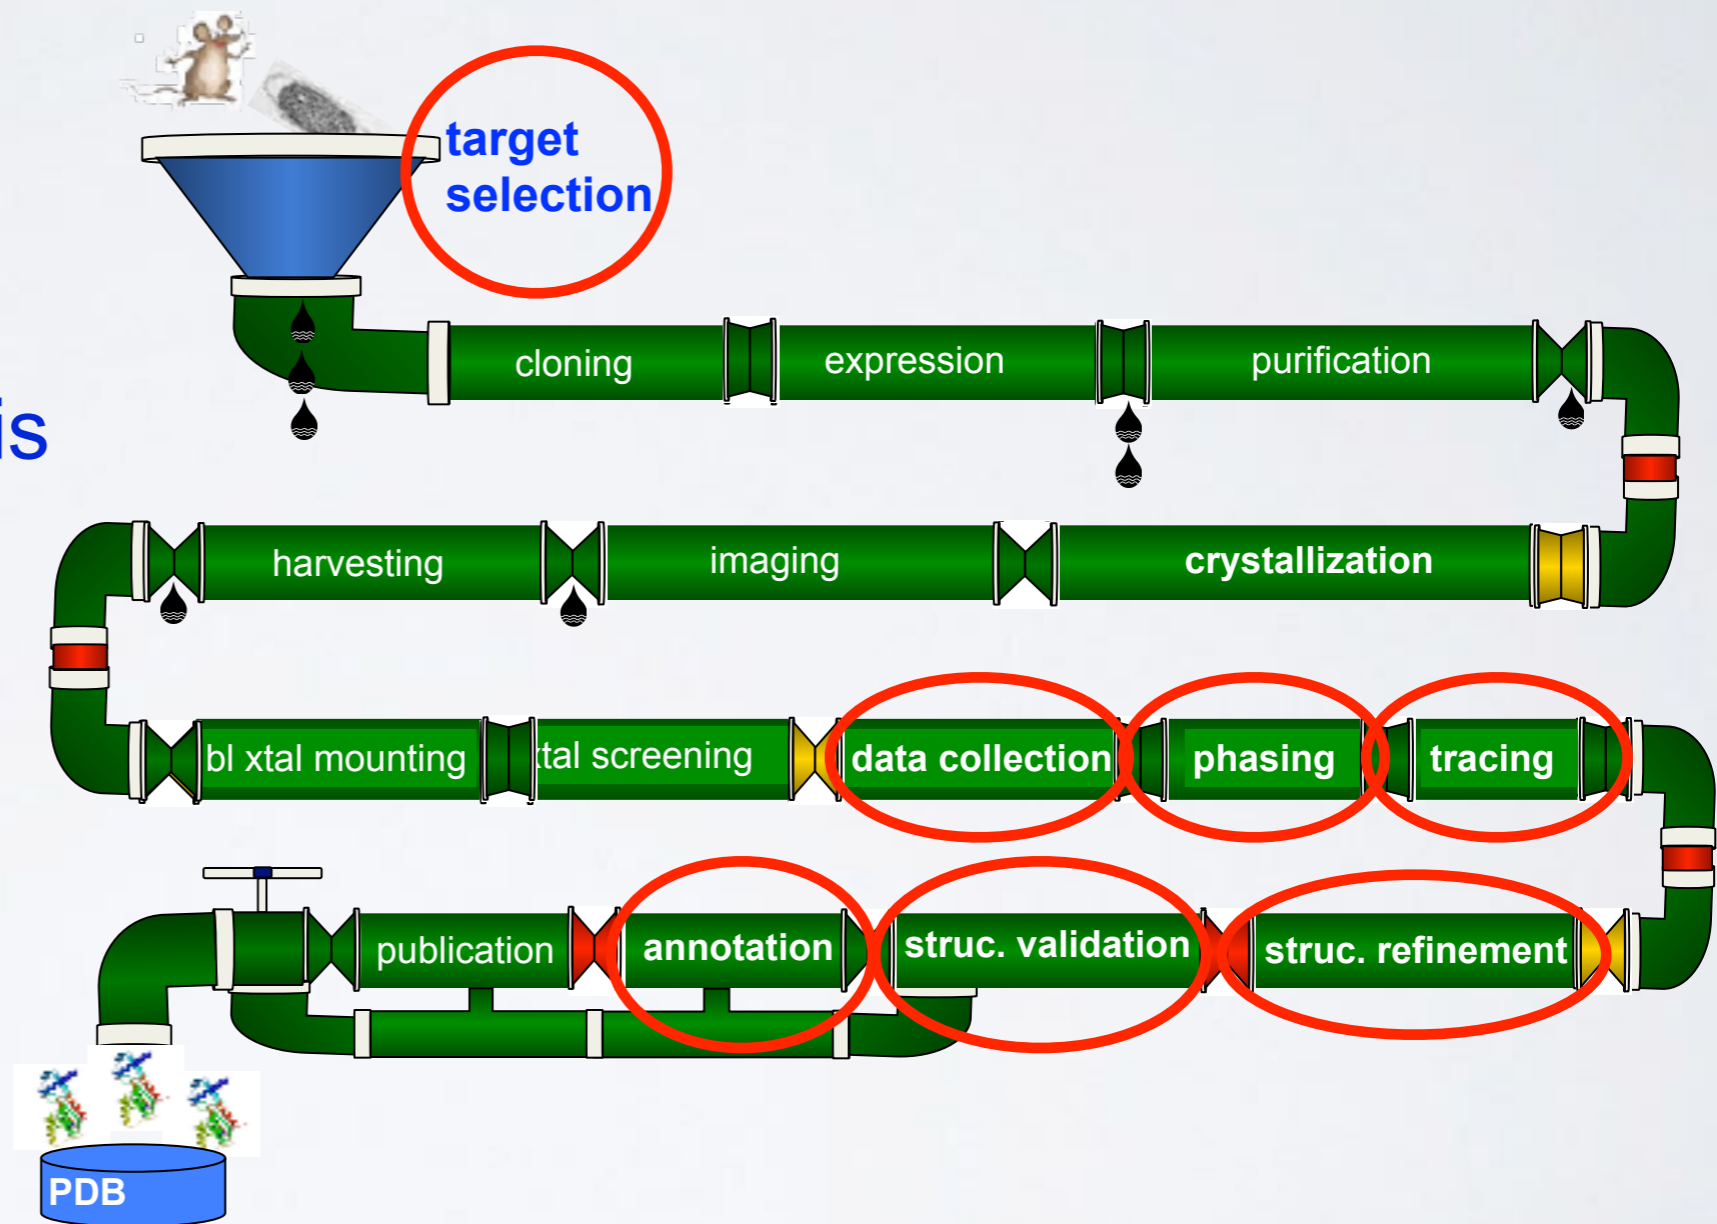

Image Credit: "Structure determination assembly line" Adam Godzik

Motivation 3:

Theoretical and computational predictions have been, and continue to be, enormously valuable and influential!

SUMMARY OF KEY **MOTIVATIONS**

Sequence > Structure > Function

- Structure determines function, so understanding structure helps our understanding of function

Structure is more conserved than sequence

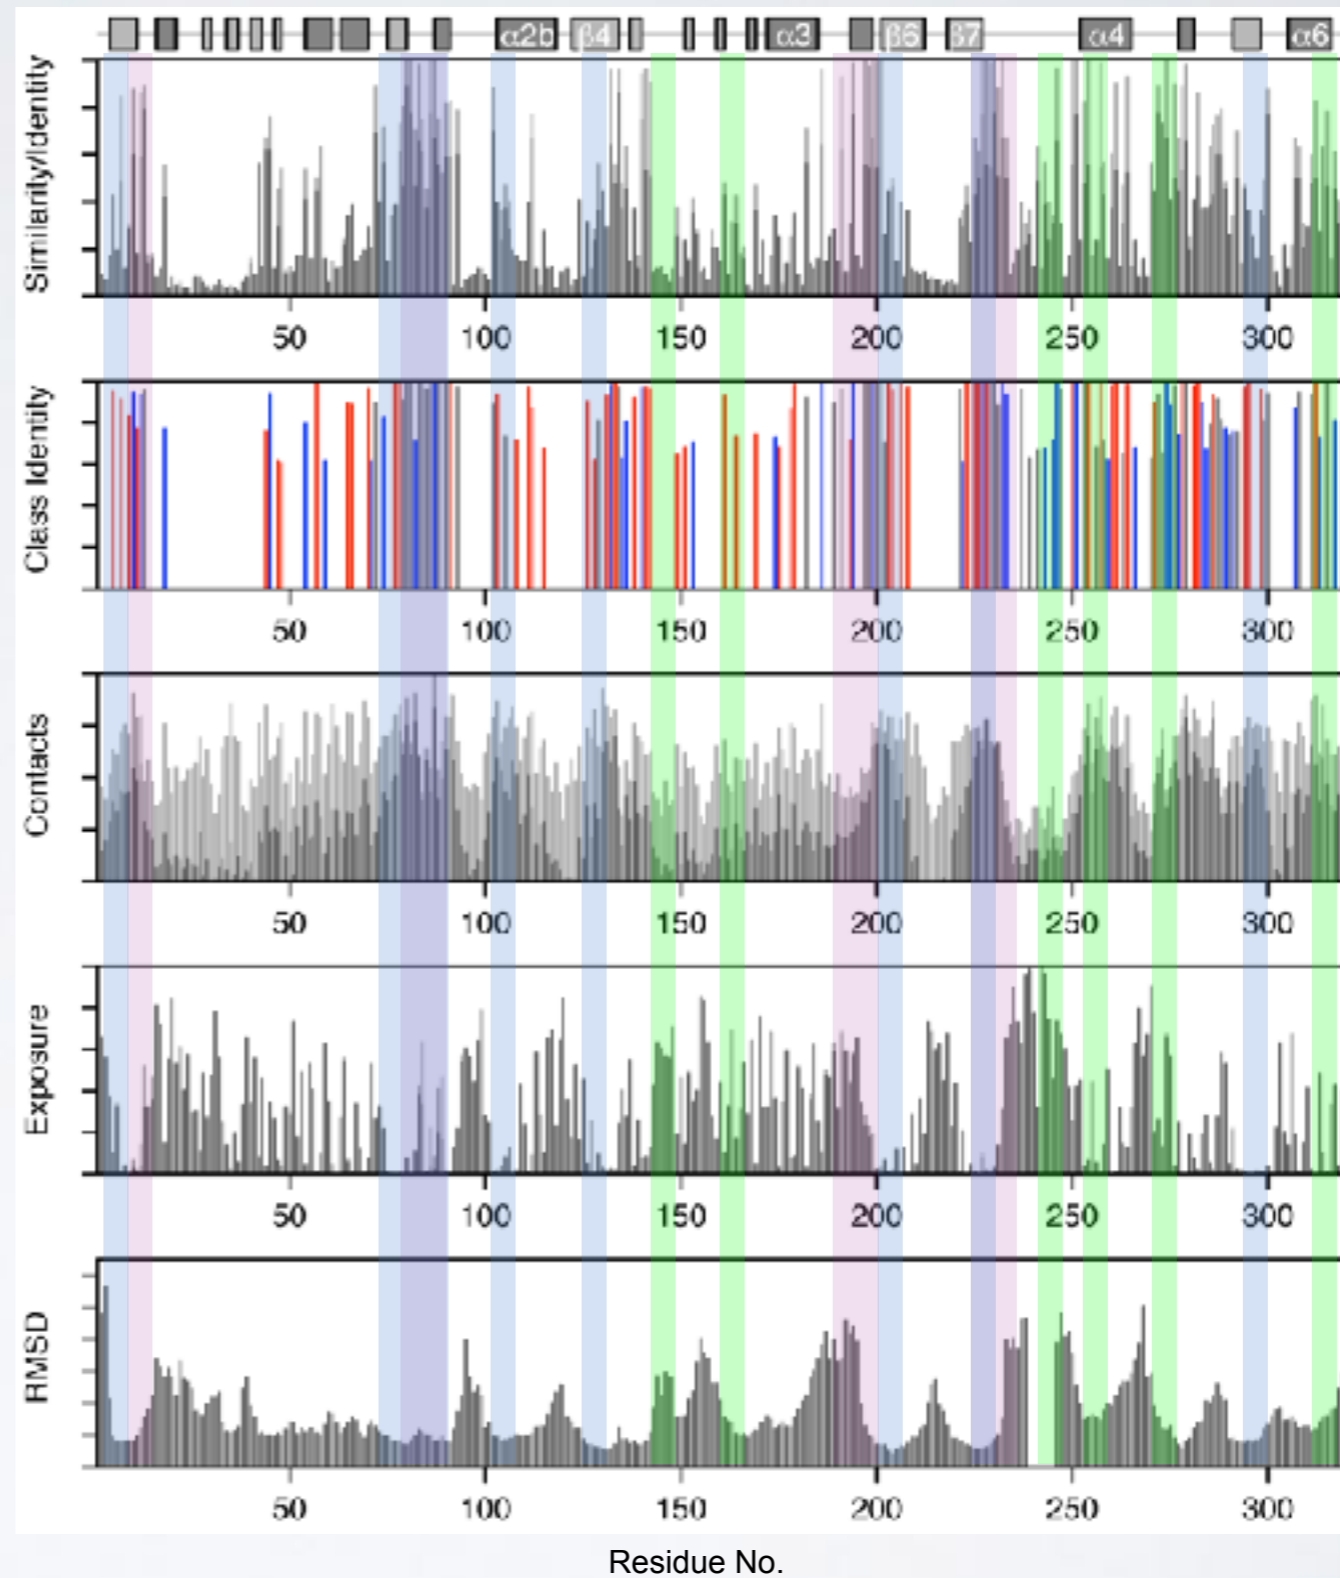

- Structure allows identification of more distant evolutionary relationships

Structure is encoded in sequence

- Understanding the determinants of structure allows design and manipulation of proteins for industrial and medical advantage

MAJOR RESEARCH AREAS AND CHALLENGES

Include but are not limited to:

- Protein classification
- Structure prediction from sequence
- Binding site detection
- Binding prediction and drug design
- Modeling molecular motions
- Predicting physical properties (stability, binding affinities)
- Design of structure and function
- etc...

With applications to Biology, Medicine, Agriculture and Industry

HIERARCHICAL STRUCTURE OF PROTEINS

Primary > Secondary > Tertiary > Quaternary

amino acid
residues

Alpha
helix

Polypeptide
chain

Assembled
subunits

RECAP: AMINO ACID NOMENCLATURE

AMINO ACIDS CAN BE GROUPED BY THE PHYSIOCHEMICAL PROPERTIES

AMINO ACIDS POLYMERIZE THROUGH **PEPTIDE BOND** FORMATION

PEPTIDES CAN ADOPT DIFFERENT CONFORMATIONS BY VARYING THEIR **PHI & PSI BACKBONE TORSIONS**

Image from: <http://www.ncbi.nlm.nih.gov/books/NBK21581/>

PHI vs PSI PLOTS ARE KNOWN AS **RAMACHANDRAN DIAGRAMS**

- Steric hindrance dictates torsion angle preference
- Ramachandran plot show preferred regions of ϕ and ψ dihedral angles which correspond to major forms of **secondary structure**

MAJOR SECONDARY STRUCTURE TYPES

ALPHA HELIX & BETA SHEET

α -helix

- Most common form has 3.6 residues per turn (number of residues in one full rotation)
- Hydrogen bonds (dashed lines) between residue i and $i+4$ stabilize the structure
- The side chains (in green) protrude outward
- **3_{10} -helix** and **π -helix** forms are less common

MAJOR SECONDARY STRUCTURE TYPES

ALPHA HELIX & **BETA SHEET**

In antiparallel β -sheets

- Adjacent β -strands run in opposite directions
- Hydrogen bonds (dashed lines) between NH and CO stabilize the structure
- The side chains (in green) are above and below the sheet

Image from: <http://www.ncbi.nlm.nih.gov/books/NBK21581/>

MAJOR SECONDARY STRUCTURE TYPES

ALPHA HELIX & **BETA SHEET**

In parallel β -sheets

- Adjacent β -strands run in same direction
- Hydrogen bonds (dashed lines) between NH and CO stabilize the structure
- The side chains (in green) are above and below the sheet

Image from: <http://www.ncbi.nlm.nih.gov/books/NBK21581/>

What Does a Protein Look like?

- Proteins are stable (and hidden) in water

- Proteins closely interact with water

- Proteins are close packed solid but flexible objects (globular)

- Due to their large size and complexity it is often hard to see what's important in the structure

- Backbone or main-chain representation can help trace chain topology

- Backbone or main-chain representation can help trace chain topology & reveal secondary structure

- Simplified secondary structure representations are commonly used to communicate structural details
- Now we can clearly see 2^o, 3^o and 4^o structure
- Coiled chain of connected secondary structures

DISPLACEMENTS REFLECT INTRINSIC FLEXIBILITY

KEY CONCEPT: ENERGY LANDSCAPE

Key forces affecting structure:

- H-bonding
- Van der Waals
- Electrostatics
- Hydrophobicity

Hydrogen-bond donor Hydrogen-bond acceptor

← d →

$$2.6 \text{ \AA} < d < 3.1 \text{ \AA}$$

$$150^\circ < \theta < 180^\circ$$

Key forces affecting structure:

- H-bonding
- **Van der Waals**
- Electrostatics
- Hydrophobicity

Key forces affecting structure:

- H-bonding
- Van der Waals
- **Electrostatics**
- Hydrophobicity

carboxyl group and amino group

(some time called IONIC BONDS or SALT BRIDGES)

Coulomb's law

$$E = \frac{K q_1 q_2}{D r}$$

E = Energy

k = constant

D = Dielectric constant (vacuum = 1; H₂O = 80)

q₁ & q₂ = electronic charges (Coulombs)

r = distance (Å)

Key forces affecting structure:

- H-bonding
- Van der Waals
- Electrostatics
- **Hydrophobicity**

The force that causes hydrophobic molecules or nonpolar portions of molecules to aggregate together rather than to dissolve in water is called Hydrophobicity (*Greek, "water fearing"*). This is not a separate bonding force; rather, it is the result of the energy required to insert a nonpolar molecule into water.

Two main approaches:

(1). Physics-Based

(2). Knowledge-Based

PHYSICS-BASED POTENTIALS

ENERGY TERMS FROM PHYSICAL THEORY

$$\begin{aligned}
 U(\vec{R}) = & \underbrace{\sum_{\text{bonds}} k_i^{\text{bond}} (r_i - r_0)^2}_{U_{\text{bond}}} + \underbrace{\sum_{\text{angles}} k_i^{\text{angle}} (\theta_i - \theta_0)^2}_{U_{\text{angle}}} + \\
 & \underbrace{\sum_{\text{dihedrals}} k_i^{\text{dihe}} [1 + \cos(n_i \phi_i + \delta_i)]}_{U_{\text{dihedral}}} + \\
 & \underbrace{\sum_i \sum_{j \neq i} 4\epsilon_{ij} \left[\left(\frac{\sigma_{ij}}{r_{ij}} \right)^{12} - \left(\frac{\sigma_{ij}}{r_{ij}} \right)^6 \right]}_{U_{\text{nonbond}}} + \sum_i \sum_{j \neq i} \frac{q_i q_j}{\epsilon r_{ij}}
 \end{aligned}$$

U_{bond} = oscillations about the equilibrium bond length

U_{angle} = oscillations of 3 atoms about an equilibrium bond angle

U_{dihedral} = torsional rotation of 4 atoms about a central bond

U_{nonbond} = non-bonded energy terms (electrostatics and Lennard-Jones)

TOTAL POTENTIAL ENERGY

$$F(x) = -dU/dx$$

- The total potential energy or enthalpy fully defines the system, U .
- The forces are the gradients of the energy.
- The energy is a sum of independent terms for:
Bond, Bond angles, Torsion angles and non-bonded atom pairs.

Slide Credit: Michael Levitt

MOVING OVER THE ENERGY SURFACE

- Energy Minimization drops into local minimum.

- Molecular Dynamics uses thermal energy to move smoothly over surface.

- Monte Carlo Moves are random. Accept with probability $\exp(-\Delta U/kT)$.

Slide Credit: Michael Levitt

PHYSICS-ORIENTED APPROACHES

Weaknesses

Fully physical detail becomes computationally intractable

Approximations are unavoidable

(Quantum effects approximated classically, water may be treated crudely)

Parameterization still required

Strengths

Interpretable, provides guides to design

Broadly applicable, in principle at least

Clear pathways to improving accuracy

Status

Useful, widely adopted but far from perfect

Multiple groups working on fewer, better approxs

Force fields, quantum

entropy, water effects

Moore's law: hardware improving

HOW COMPUTERS HAVE CHANGED

DATE	COST	SPEED	MEMORY	SIZE
1967	\$40M	0.1 MHz	1 MB	WALL
2013	\$4,000	1 GHz	10 GB	LAPTOP
CHANGE	10,000	10,000	10,000	10,000

If cars were like computers then a new Volvo would cost \$3, would have a top speed of 1,000,000 km/hr, would carry 50,000 adults and would park in a shedbox

SIDE-NOTE: GPUS AND ANTON SUPERCOMPUTER

SIDE-NOTE: GPUS AND ANTON SUPERCOMPUTER

KEY CONCEPT: POTENTIAL FUNCTIONS
DESCRIBE A SYSTEMS **ENERGY** AS A FUNCTION
OF ITS **STRUCTURE**

Two main approaches:

(1). **Physics-Based**

(2). **Knowledge-Based**

KNOWLEDGE-BASED DOCKING POTENTIALS

ENERGY DETERMINES **PROBABILITY** (STABILITY)

Basic idea: Use probability as a proxy for energy

Boltzmann:

$$p(r) \propto e^{-E(r)/RT}$$

Inverse Boltzmann:

$$E(r) = -RT \ln [p(r)]$$

Example: ligand **carboxylate O** to protein **histidine N**

Find all protein-ligand structures in the PDB with a ligand carboxylate **O**

1. For each structure, histogram the distances from **O** to every histidine **N**
2. Sum the histograms over all structures to obtain $p(r_{\text{O-N}})$
3. Compute $E(r_{\text{O-N}})$ from $p(r_{\text{O-N}})$

KNOWLEDGE-BASED DOCKING POTENTIALS

“PMF”, Muegge & Martin, J. Med. Chem. (1999) 42:791

A few types of atom pairs, out of several hundred total

Nitrogen⁺/Oxygen⁻

Aromatic carbons

Aliphatic carbons

Atom-atom distance (Angstroms)

$$E_{prot-lig} = E_{vdw} + \sum_{pairs (ij)} E_{type(ij)}(r_{ij})$$

KNOWLEDGE-BASED POTENTIALS

Weaknesses

Accuracy limited by availability of data

Strengths

Relatively easy to implement

Computationally fast

Status

Useful, far from perfect

May be at point of diminishing returns

(not always clear how to make improvements)

Do it Yourself!

Focus on **section 4 & 5**

NEXT UP:

- ▶ **Overview of structural bioinformatics**

- Major motivations, goals and challenges

- ▶ **Fundamentals of protein structure**

- Composition, form, forces and dynamics

- ▶ **Representing and interpreting protein structure**

- Modeling energy as a function of structure

- ▶ **Example application areas**

- Predicting functional dynamics & drug discovery

PREDICTING FUNCTIONAL DYNAMICS

- Proteins are intrinsically flexible molecules with internal motions that are often intimately coupled to their biochemical function
 - E.g. ligand and substrate binding, conformational activation, allosteric regulation, etc.
- Thus knowledge of dynamics can provide a deeper understanding of the mapping of structure to function
 - Molecular dynamics (MD) and normal mode analysis (NMA) are two major methods for predicting and characterizing molecular motions and their properties

MOLECULAR DYNAMICS SIMULATION

McCammon, Gelin & Karplus, *Nature* (1977)

[See: <https://www.youtube.com/watch?v=ui1ZysMFcKk>]

- ▶ Divide **time** into discrete (~ 1 fs) **time steps** (Δt)
(for integrating equations of motion, see below)

- ▶ Divide **time** into discrete (~ 1 fs) **time steps** (Δt)
(for integrating equations of motion, see below)

- ▶ At each time step calculate pair-wise atomic **forces** ($F(t)$)
(by evaluating **force-field** gradient)

Nucleic motion described classically

$$m_i \frac{d^2 \vec{R}_i}{dt^2} = -\vec{\nabla}_i E(\vec{R})$$

Empirical force field

$$E(\vec{R}) = \sum_{\text{bonded}} E_i(\vec{R}) + \sum_{\text{non-bonded}} E_i(\vec{R})$$

- ▶ Divide **time** into discrete (~ 1 fs) **time steps** (Δt)
(for integrating equations of motion, see below)

- ▶ At each time step calculate pair-wise atomic **forces** ($F(t)$)
(by evaluating **force-field** gradient)

Nucleic motion described classically

$$m_i \frac{d^2 \vec{R}_i}{dt^2} = -\vec{\nabla}_i E(\vec{R})$$

Empirical force field

$$E(\vec{R}) = \sum_{\text{bonded}} E_i(\vec{R}) + \sum_{\text{non-bonded}} E_i(\vec{R})$$

- ▶ Use the forces to calculate **velocities** and move atoms to new **positions**
(by integrating numerically via the “leapfrog” scheme)

$$\begin{aligned} \mathbf{v}\left(t + \frac{\Delta t}{2}\right) &= \mathbf{v}\left(t - \frac{\Delta t}{2}\right) + \frac{\mathbf{F}(t)}{m} \Delta t \\ \mathbf{r}(t + \Delta t) &= \mathbf{r}(t) + \mathbf{v}\left(t + \frac{\Delta t}{2}\right) \Delta t \end{aligned}$$

BASIC ANATOMY OF A MD SIMULATION

- ▶ Divide **time** into discrete (~ 1 fs) **time steps** (Δt)
(for integrating equations of motion, see below)

- ▶ At each time step calculate pair-wise atomic **forces** ($F(t)$)
(by evaluating **force-field** gradient)

Nucleic motion described classically

$$m_i \frac{d^2 \vec{R}_i}{dt^2} = -\vec{\nabla}_i E(\vec{R})$$

Empirical force field

$$E(\vec{R}) = \sum_{\text{non-bonded}} E_i(\vec{R})$$

REPEAT, (iterate many, many times... 1ms = 10¹² time steps)

- ▶ Use the forces to calculate **velocities** and move atoms to new **positions**
(this is done numerically via the "leapfrog" scheme)

$$\begin{aligned} \mathbf{v}(t + \frac{\Delta t}{2}) &= \mathbf{v}(t - \frac{\Delta t}{2}) + \frac{\mathbf{F}(t)}{m} \Delta t \\ \mathbf{r}(t + \Delta t) &= \mathbf{r}(t) + \mathbf{v}(t + \frac{\Delta t}{2}) \Delta t \end{aligned}$$

MD Prediction of Functional Motions

Accelerated MD simulation of
nucleotide-free transducin alpha subunit

Yao and Grant, Biophys J. (2013)

Simulations Identify Key Residues Mediating Dynamic Activation

EXAMPLE APPLICATION OF MOLECULAR SIMULATIONS TO GPCRS

PROTEINS JUMP BETWEEN MANY, HIERARCHICALLY ORDERED “CONFORMATIONAL SUBSTATES”

H. Frauenfelder et al., *Science* **229** (1985) 337

MOLECULAR DYNAMICS IS VERY

Example: F_1 -ATPase in water (183,674 atoms) for 1 nanosecond:

=> 10^6 integration steps

=> $8.4 * 10^{11}$ floating point operations/step

[$n(n-1)/2$ interactions]

Total: $8.4 * 10^{17}$ flop

(on a 100 Gflop/s cpu: **ca 25 years!**)

... but performance has been improved by use of:

multiple time stepping ca. 2.5 years

fast multipole methods ca. 1 year

parallel computers ca. 5 days

modern GPUs **ca. 1 day**

(Anton supercomputer ca. minutes)

COARSE GRAINING: **NORMAL MODE ANALYSIS** (NMA)

- MD is still time-consuming for large systems
- Elastic network model NMA (ENM-NMA) is an example of a lower resolution approach that finishes in seconds even for large systems.

NMA models the protein as a network of elastic strings

Proteinase K

Focus on **section 6** to **7**

SUMMARY

- Structural bioinformatics is computer aided structural biology
- Described major motivations, goals and challenges of structural bioinformatics
- Reviewed the fundamentals of protein structure
- Introduced both physics and knowledge based modeling approaches for describing the structure, energetics and dynamics of proteins computationally

Optional:

Stop here for Today!

NEXT UP:

- ▶ **Overview of structural bioinformatics**
 - Major motivations, goals and challenges
- ▶ **Fundamentals of protein structure**
 - Composition, form, forces and dynamics
- ▶ **Representing and interpreting protein structure**
 - Modeling energy as a function of structure
- ▶ **Example application areas**
 - Predicting functional dynamics & drug discovery

CAUTIONARY NOTES

- **“Everything should be made as simple as it can be but not simpler”**

A model is **never perfect**. A model that is not quantitatively accurate in every respect does not preclude one from establishing results relevant to our understanding of biomolecules as long as the biophysics of the model are properly understood and explored.

- **Calibration of the parameters is an ongoing and imperfect process**

Questions and hypotheses should always be designed such that they do not depend crucially on the precise numbers used for the various parameters.

- **A computational model is rarely universally right or wrong**

A model may be accurate in some regards, inaccurate in others. These subtleties can only be uncovered by comparing to all available experimental data.

THE TRADITIONAL EMPIRICAL PATH TO DRUG DISCOVERY

COMPUTER-AIDED LIGAND DESIGN
