

# **Recap of Lecture 8**

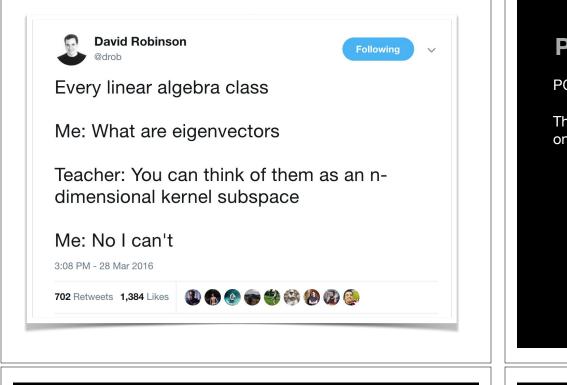

- Introduction to machine learning
  - Unsupervised, supervised and reinforcement learning
- Clustering
  - K-means clustering
  - Hierarchical clustering
- Dimensionality reduction, visualization and 'structure' analysis
  - Principal Component Analysis (PCA)

[Muddy Point Feedback Link] :-(

### **Recap: PCA objectives**

- To reduce dimensionality
- To visualize multidimensional data
- To choose the most useful variables (features)
- To identify groupings of objects (e.g. genes/samples)
- To identify outliers

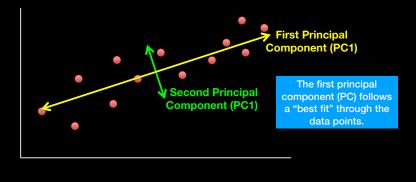

A long time ago in a galaxy far, far away....

### **PCA:** Principal Component Analysis

PCA projects the features onto the principal components.

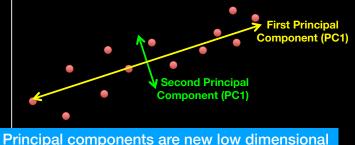

The motivation is to reduce the features dimensionality while only losing a small amount of information.

### **PCA:** Principal Component Analysis

PCA projects the features onto the principal components.

The motivation is to reduce the features dimensionality while only losing a small amount of information.

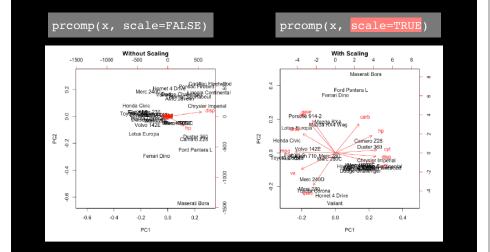

axis (or surfaces) closest to the observations

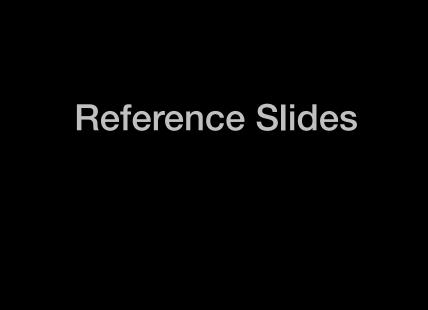

# Practical PCA issue: Scaling

### **Practical PCA issue:** Scaling

#### Your turn! **Unsupervised Learning Mini-Project** Input: read, View/head, PCA: prcomp, Cluster: kmeans, hclust Compare: plot, table, etc. This PCA plot shows clusters of cell types. This graph was drawn from single-cell RNA-seq. There were about 10,000 transcribed genes in each cell. ### This PCA plot shows clusters of cell types.

Each dot represents a single-cell and its transcription profile The general idea is that cells with similar transcription should cluster.

### This PCA plot shows clusters of cell types.

How does transcription from 10,000 genes get compressed to a single dot on a graph?

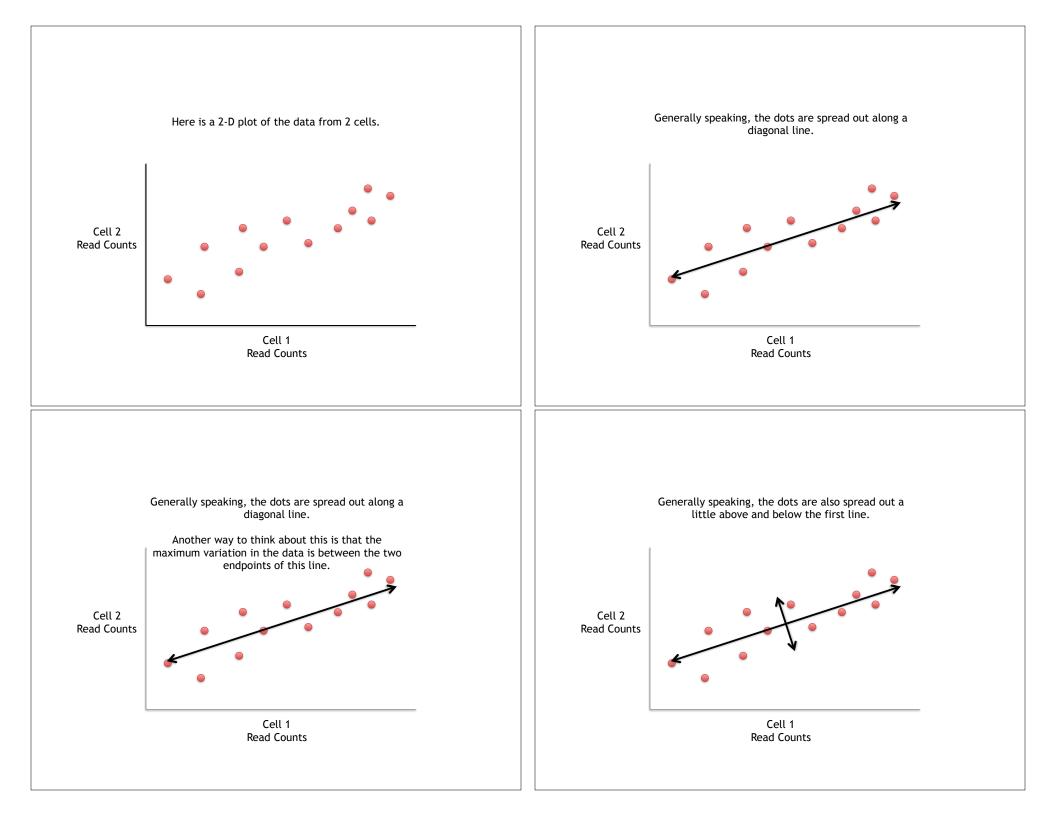

### What does PCA aim to do?

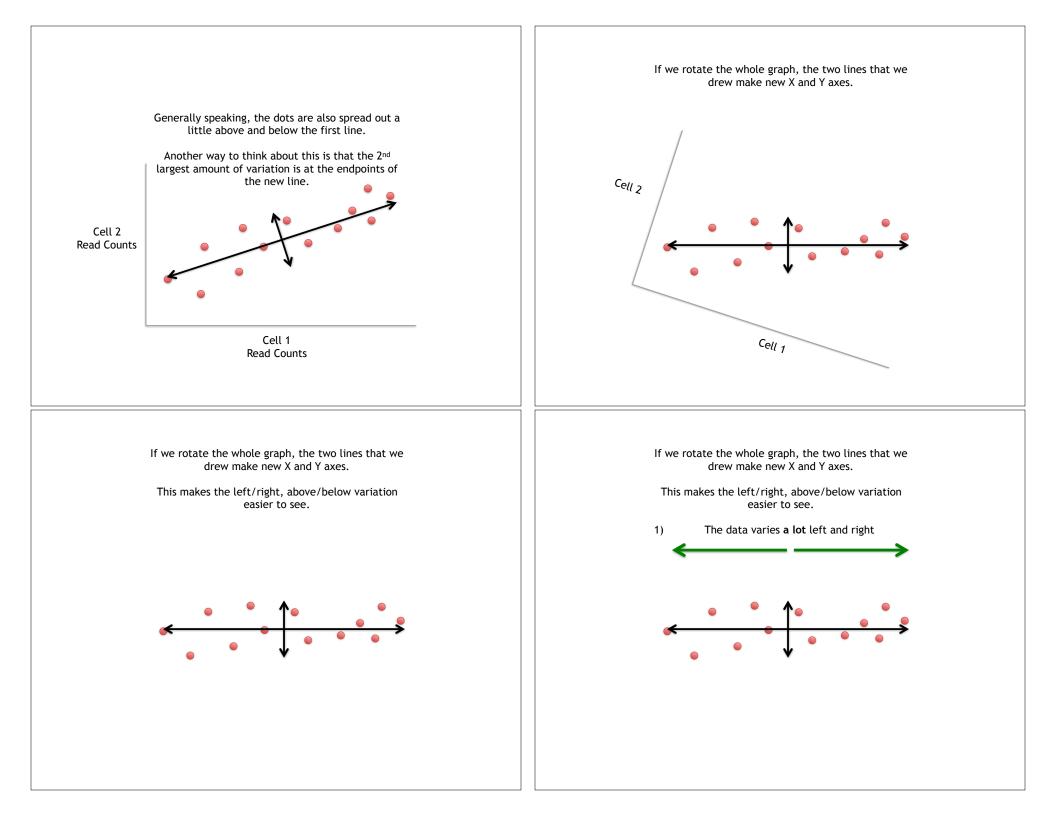

- PCA takes a dataset with a lot of dimensions (i.e. lots of cells) and flattens it to 2 or 3 dimensions so we can look at it.
  - It tries to find a meaningful way to flatten the data by focusing on the things that are different between cells. (much, much more on this later)

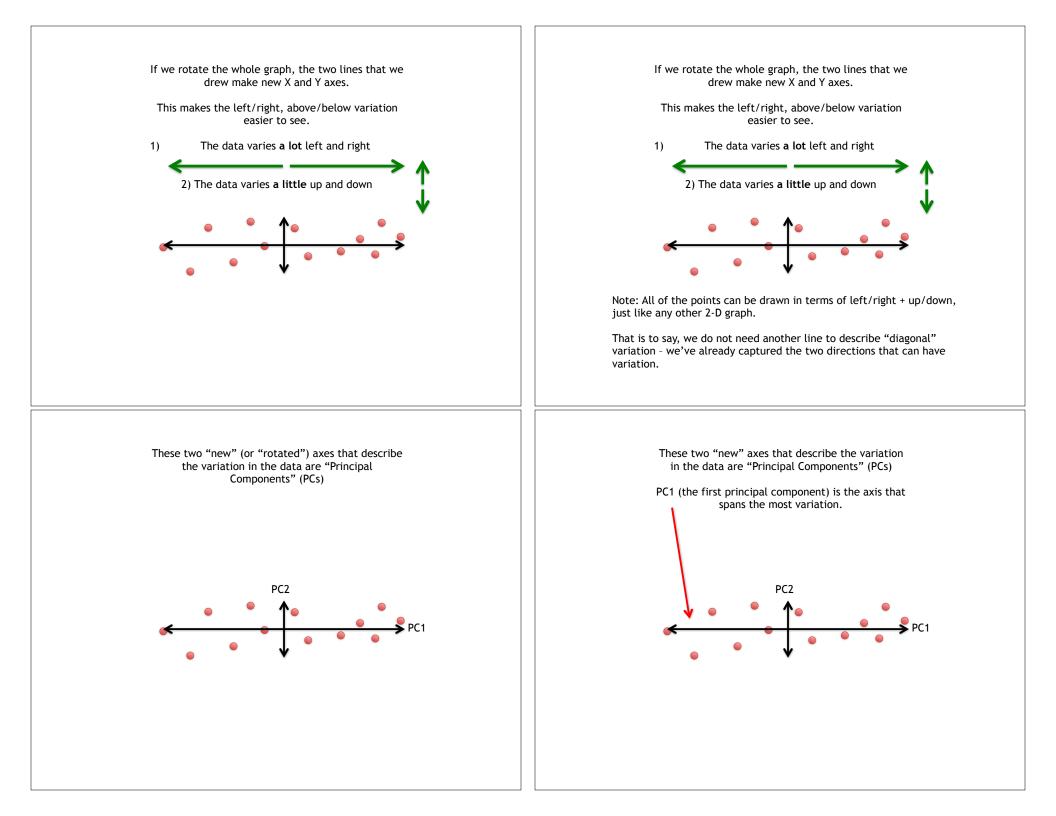

### A PCA example

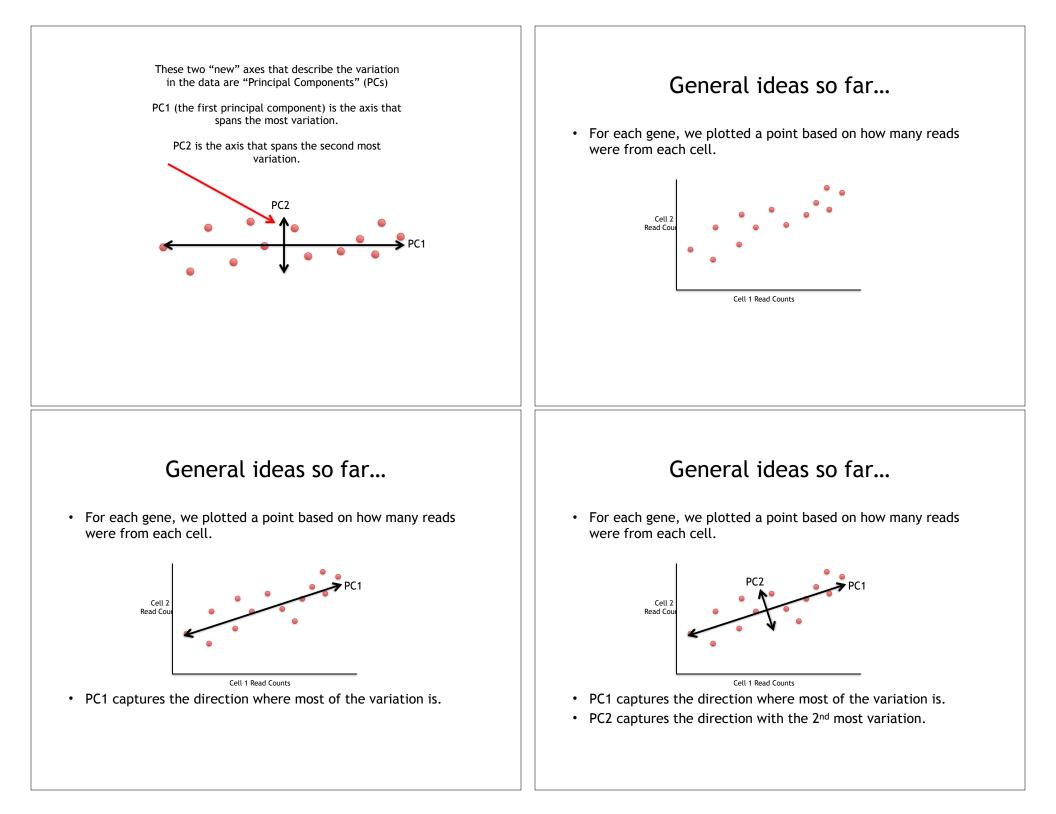

Again, we'll start with just two cells Here's the data:

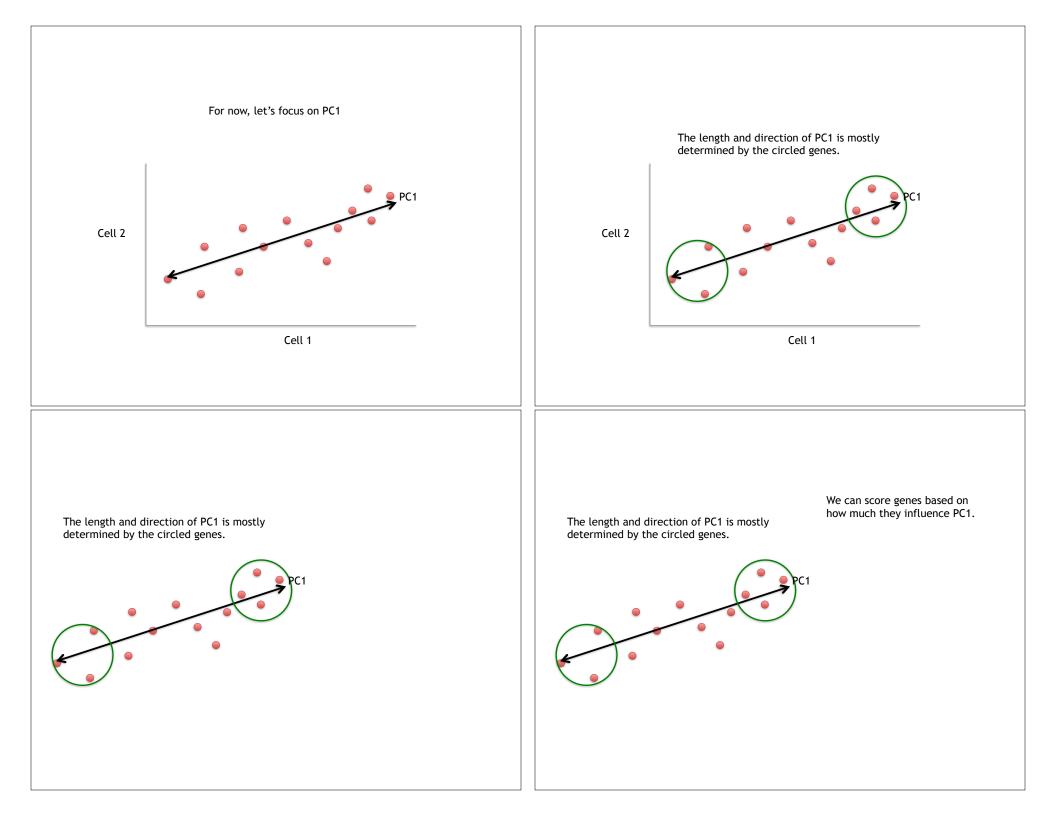

Gene	Cell1 reads	Cell2 reads
a	10	8
b	0	2
с	14	10
d	33	45
e	50	42
f	80	72
g	95	90
h	44	50
i	60	50
(etc)	(etc)	(etc)

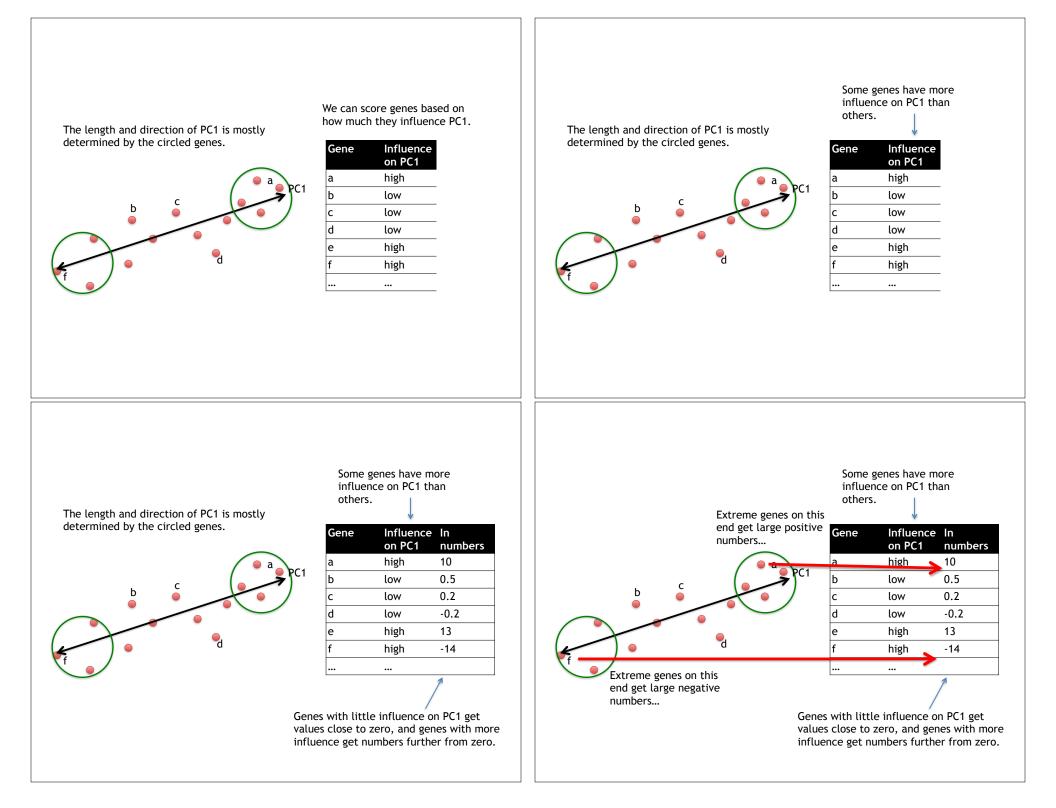

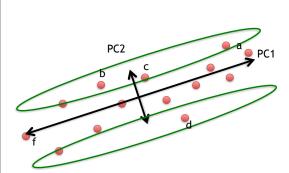

### Genes that influence PC2

Gene	Influence on PC2	In numbers
a	medium	3
b	high	10
с	high	8
d	high	-12
e	low	0.2
f	low	-0.1

#### Our two PCs
