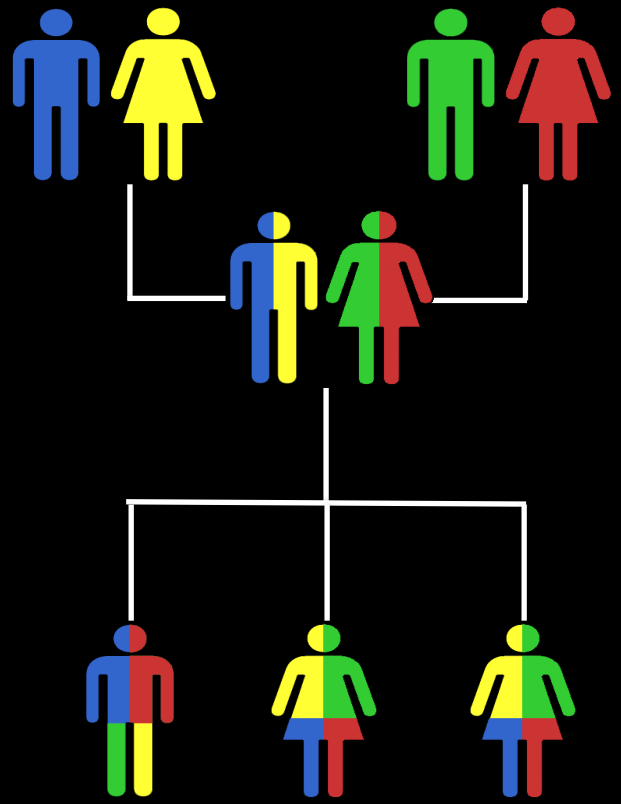
  - RNA-Sequencing and Discovering variation

What is a genome?

The total genetic material of an organism by which individual traits are encoded, controlled, and ultimately passed on to future generations



Genetics and Genomics

Side note!

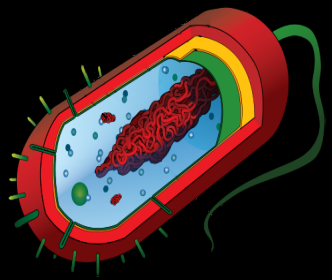
- **Genetics** is primarily the study of *individual genes*, mutations within those genes, and their inheritance patterns in order to understand specific traits.

- **Genomics** expands upon classical genetics and considers aspects of the *entire genome*, typically using computer aided approaches.

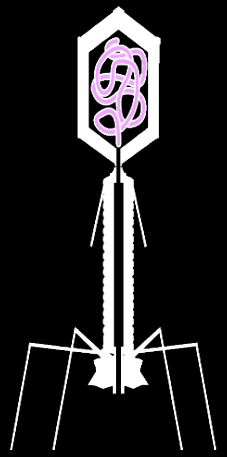
Genomes come in many shapes

Side note!

- Primarily DNA, but can be RNA in the case of some viruses
- Some genomes are circular, others linear
- Can be organized into discrete units (chromosomes) or freestanding molecules (plasmids)



Prokaryote



Bacteriophage

Eukaryote

Side note!

CHROMOSOMES CLOSE-UP

Chromosomes consist largely of double-helical DNA. Cells package the DNA into the nucleus by wrapping it around “spools” composed of histone proteins. The DNA-protein combination is known as chromatin. (Each color represents one chromosome.)

Under a microscope, a Eukaryotic cell's genome (i.e. collection of chromosomes) resembles a chaotic jumble of noodles. The looping is not random however and appears to play a role in controlling gene regulation.

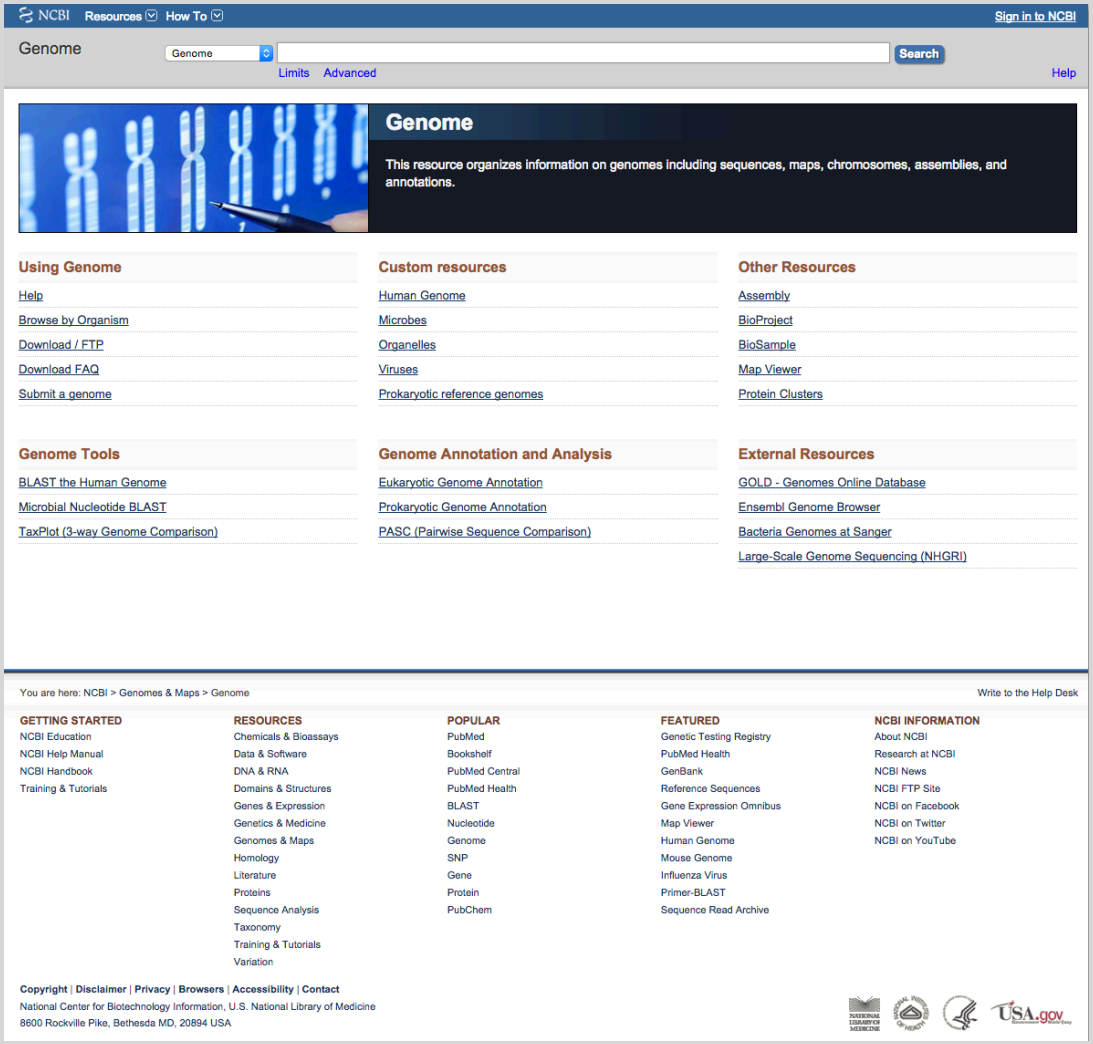
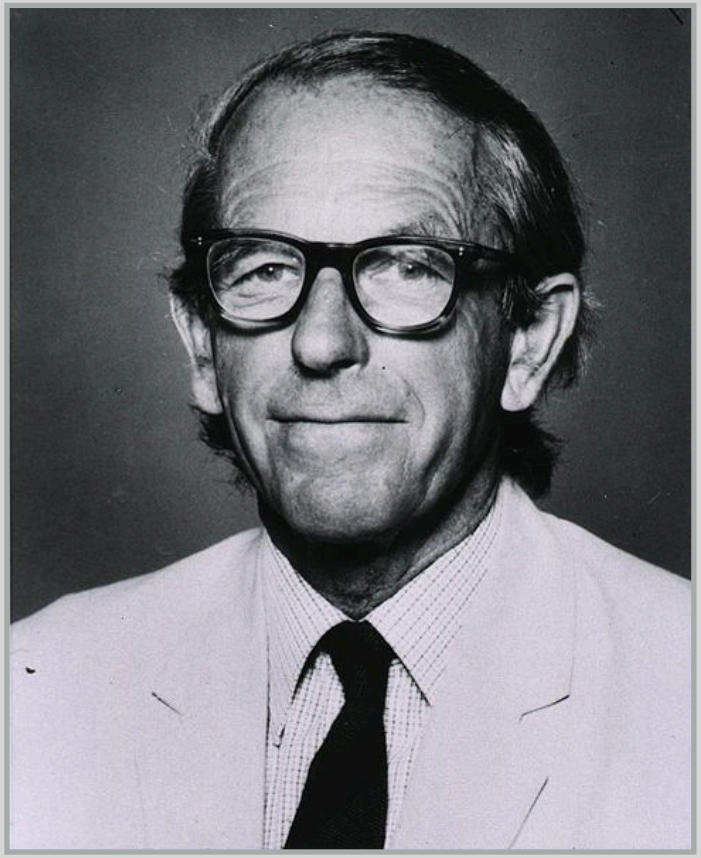
http://www.ncbi.nlm.nih.gov/genome



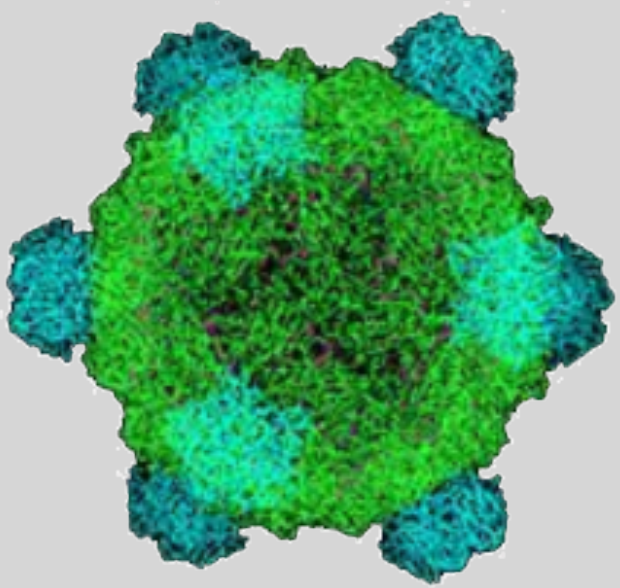
Early Genome Sequencing



http://en.wikipedia.org/wiki/Frederick_Sanger

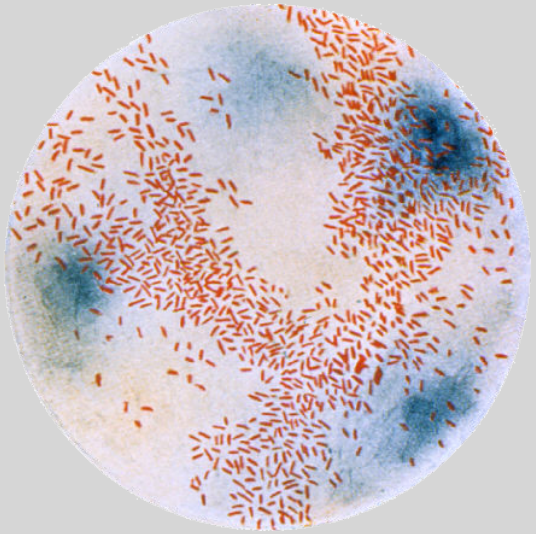
- Chain-termination “Sanger” sequencing was developed in 1977 by Frederick Sanger, colloquially referred to as the “Father of Genomics”
- Sequence reads were typically 750-1000 base pairs in length with an error rate of ~1 / 10000 bases

The First Sequenced Genomes



Bacteriophage φ-X174

- Completed in 1977
- 5,386 base pairs, ssDNA
- 11 genes



Haemophilus influenzae

- Completed in 1995
- 1,830,140 base pairs, dsDNA
- 1740 genes

http://en.wikipedia.org/wiki/Phi_X_174

http://phil.cdc.gov/

The Human Genome Project

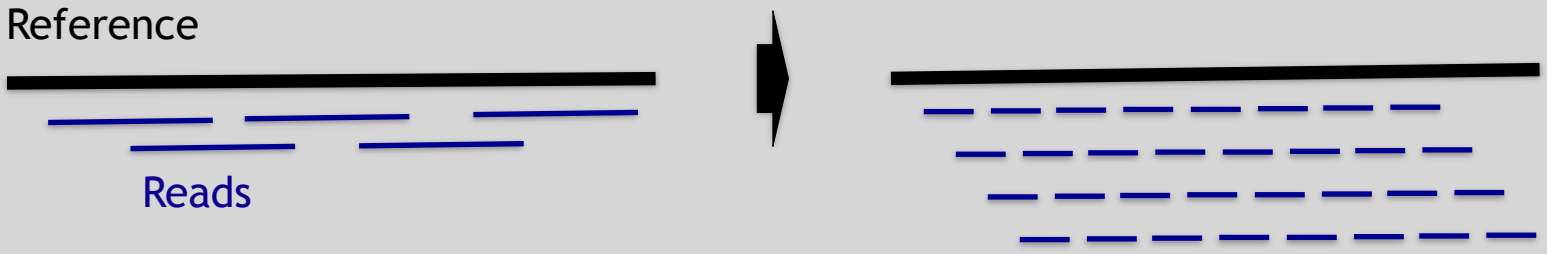
- The Human Genome Project (HGP) was an international, public consortium that began in 1990
  - Initiated by James Watson
  - Primarily led by Francis Collins
  - Eventual Cost: $2.7 Billion
- Celera Genomics was a private corporation that started in 1998
  - Headed by Craig Venter
  - Eventual Cost: $300 Million
- Both initiatives released initial drafts of the human genome in 2001
  - ~3.2 Billion base pairs, dsDNA
  - 22 autosomes, 2 sex chromosomes
  - ~20,000 genes

Jane Ades, Courtesy: National Human Genome Research Institute.

HHMI

Modern Genome Sequencing

- Next Generation Sequencing (NGS) technologies have resulted in a paradigm shift from long reads at low coverage to short reads at high coverage
- This provides numerous opportunities for new and expanded genomic applications



Rapid progress of genome sequencing

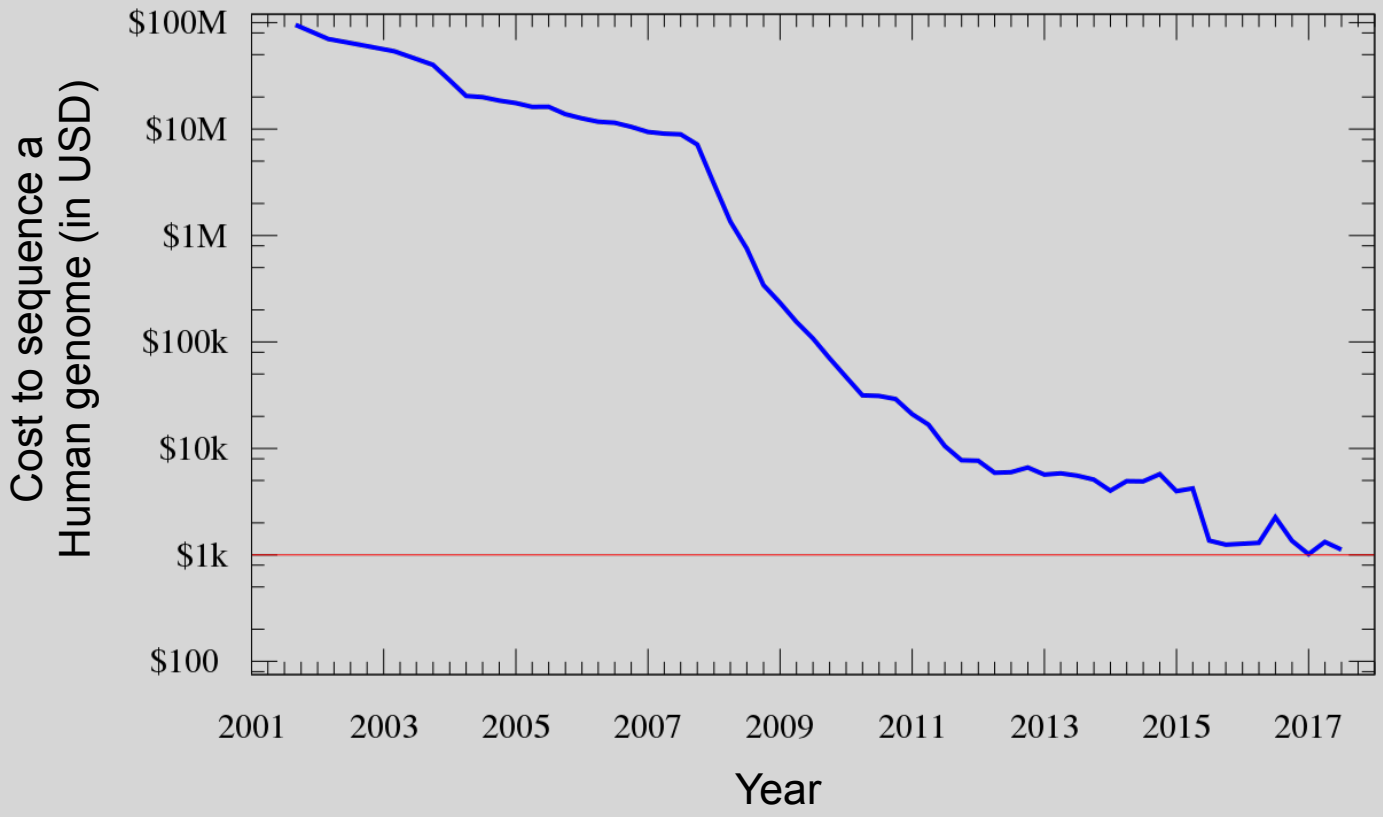


Image source: https://en.wikipedia.org/wiki/Carlson_curve

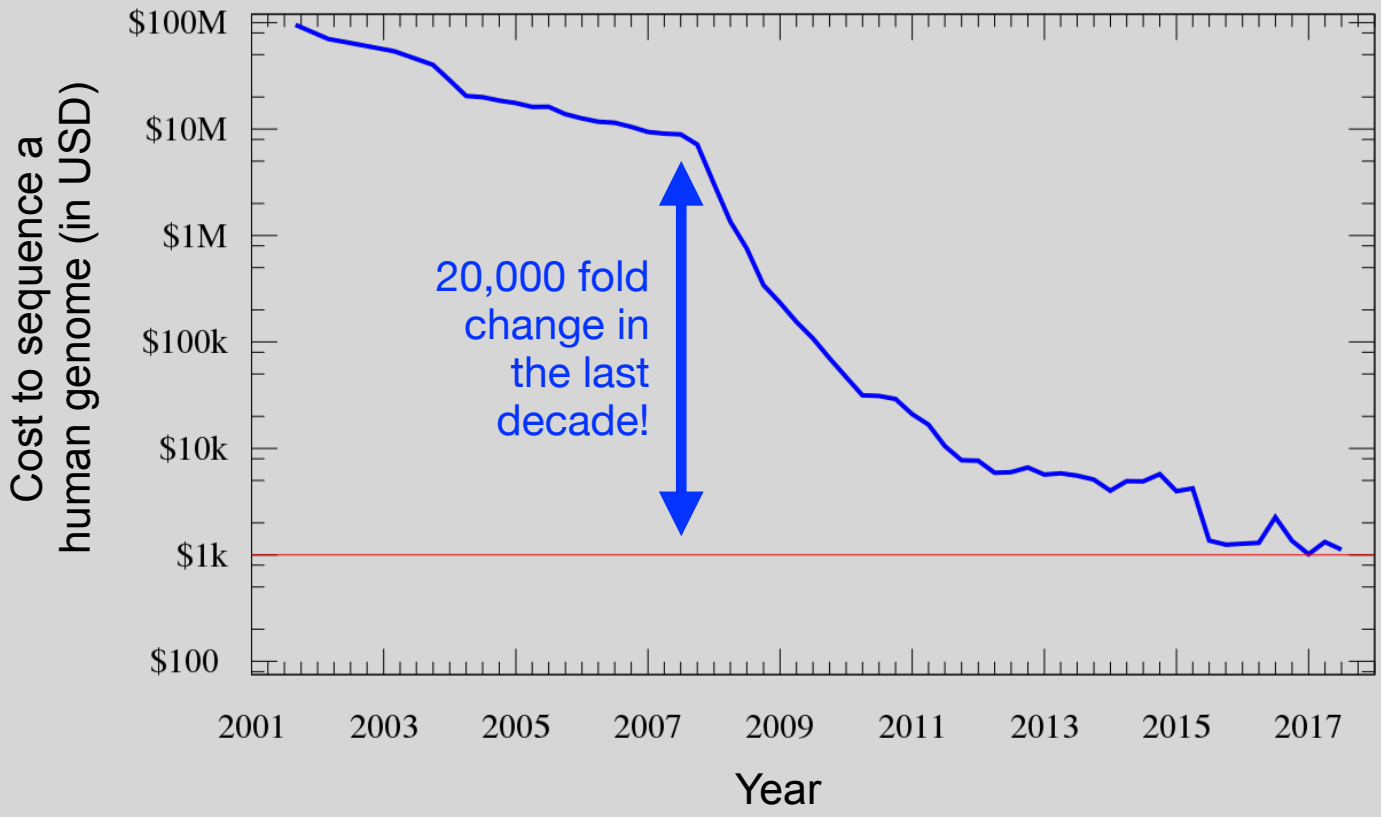
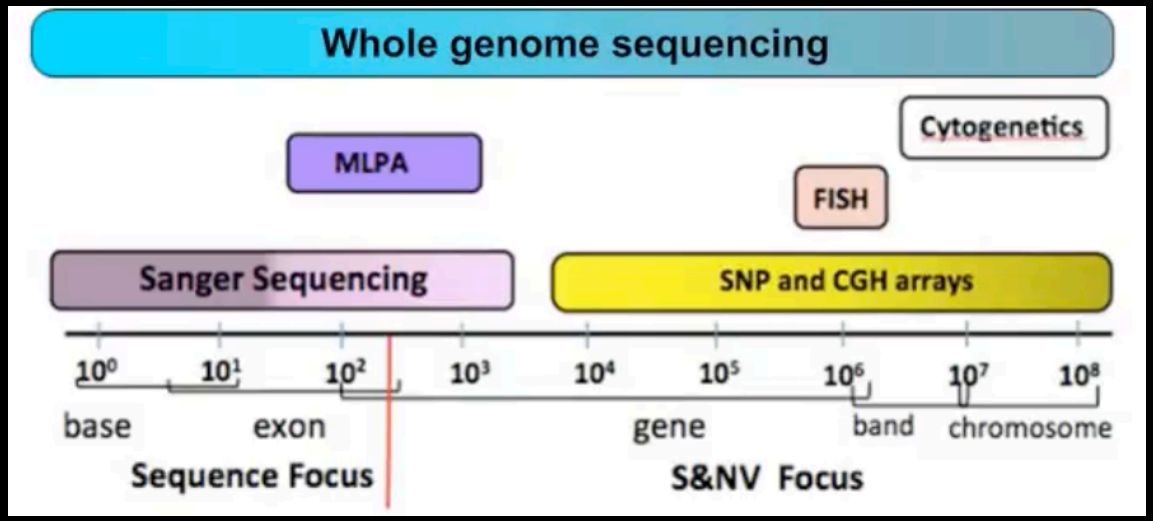
Rapid progress of genome sequencing



MRI: $4k

Image source: https://en.wikipedia.org/wiki/Carlson_curve

Whole genome sequencing transforms genetic testing



- 1000s of single gene tests
- Structural and copy number variation tests
- Permits hypothesis free diagnosis

Major impact areas for genomic medicine

- Cancer: Identification of driver mutations and drugable variants, Molecular stratification to guide and monitor treatment, Identification of tumor specific variants for personalized immunotherapy approaches (precision medicine).

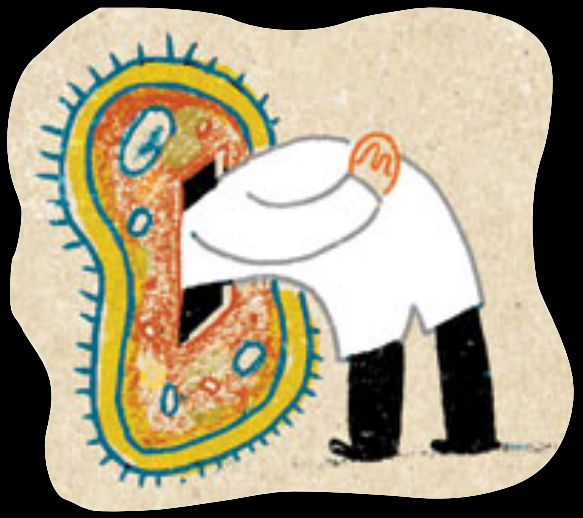
- Genetic disease diagnose: Rare, inherited and so-called ‘mystery’ disease diagnose.

- Health management: Predisposition testing for complex diseases (e.g. cardiac disease, diabetes and others), optimization and avoidance of adverse drug reactions.

- Health data analytics: Incorporating genomic data with additional health data for improved healthcare delivery.

Goals of Cancer Genome Research

- Identify changes in the genomes of tumors that drive cancer progression
- Identify new targets for therapy
- Select drugs based on the genomics of the tumor
- Provide early cancer detection and treatment response monitoring
- Utilize cancer specific mutations to derive neoantigen immunotherapy approaches



What can go wrong in cancer genomes?

Type of change	Some common technology to study changes
DNA mutations	WGS, WXS
DNA structural variations	WGS
Copy number variation (CNV)	CGH array, SNP array, WGS
DNA methylation	Methylation array, RRBS, WGBS
mRNA expression changes	mRNA expression array, RNA-seq
miRNA expression changes	miRNA expression array, miRNA-seq
Protein expression	Protein arrays, mass spectrometry

WGS = whole genome sequencing, WXS = whole exome sequencing
RRBS = reduced representation bisulfite sequencing, WGBS = whole genome bisulfite sequencing

DNA Sequencing Concepts

- **Sequencing by Synthesis**: Uses a polymerase to incorporate and assess nucleotides to a primer sequence
  - 1 nucleotide at a time

- **Sequencing by Ligation**: Uses a ligase to attach hybridized sequences to a primer sequence
  - 1 or more nucleotides at a time (e.g. dibase)

Modern NGS Sequencing Platforms

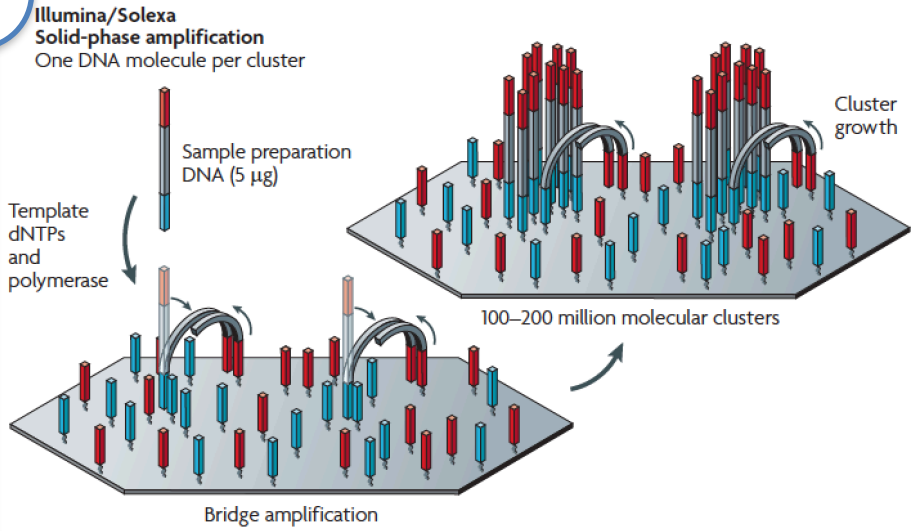
	Roche/454	Life Technologies SOLiD	Illumina Hi-Seq 2000
Library amplification method	emPCR* on bead surface	emPCR* on bead surface	Enzymatic amplification on glass surface
Sequencing method	Polymerase-mediated incorporation of unlabelled nucleotides	Ligase-mediated addition of 2-base encoded fluorescent oligonucleotides	Polymerase- mediated incorporation of end-blocked fluorescent nucleotides
Detection method	Light emitted from secondary reactions initiated by release of PPi	Fluorescent emission from ligated dye-labelled oligonucleotides	Fluorescent emission from incorporated dye-labelled nucleotides
Post incorporation method	NA (unlabelled nucleotides are added in base-specific fashion, followed by detection)	Chemical cleavage removes fluorescent dye and 3′ end of oligonucleotide	Chemical cleavage of fluorescent dye and 3′ blocking group
Error model	Substitution errors rare, insertion/ deletion errors at homopolymers	End of read substitution errors	End of read substitution errors
Read length (fragment/paired end)	400 bp/variable length mate pairs	75 bp/50+25 bp	150 bp/100+100 bp

Modified from Mardis, ER (2011), Nature, 470, pp. 198-203

Illumina – Reversible terminators

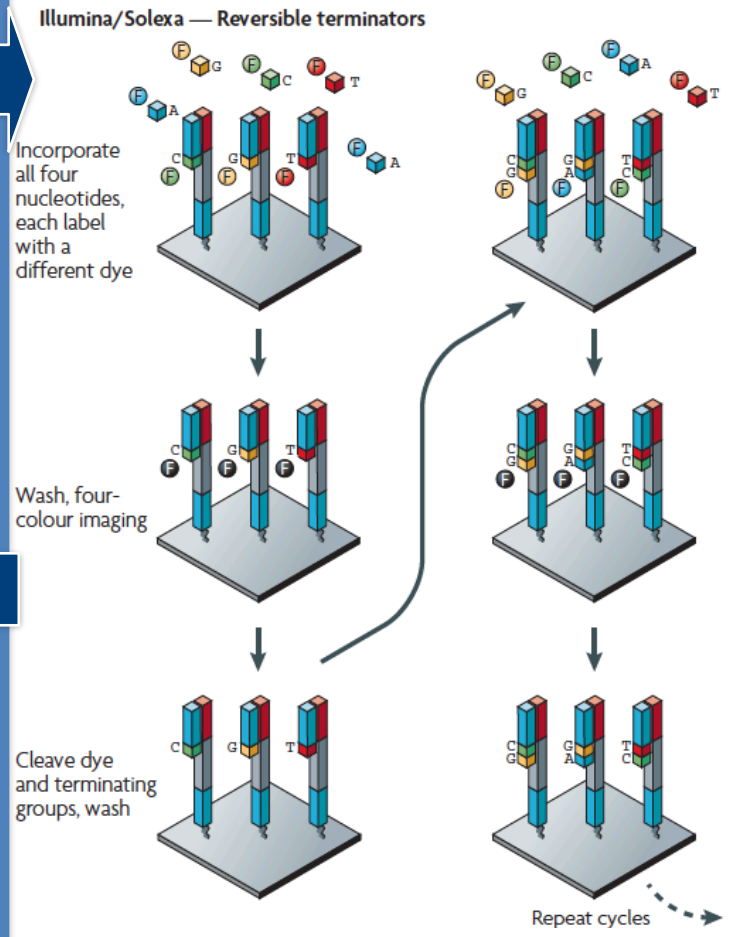
1

Enzymatic amplification on glass surface



2

Polymerase-mediated incorporation of end blocked fluorescent nucleotides



Cleave dye & blocking group, repeat…

3

Fluorescent emission from incorporated dye-labeled nucleotides

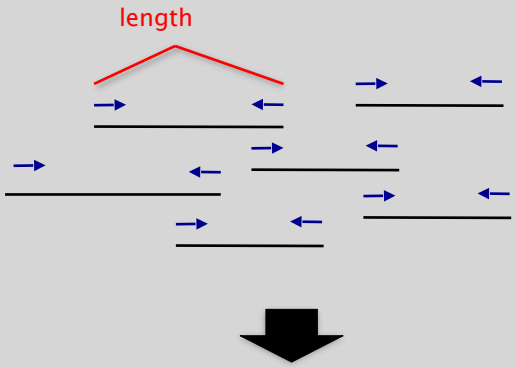
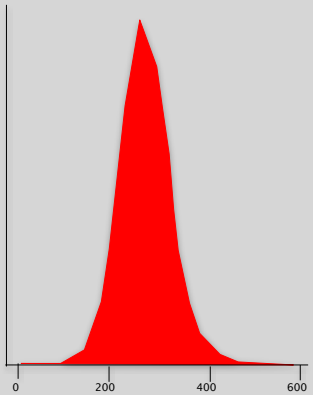
NGS Sequencing Terminology

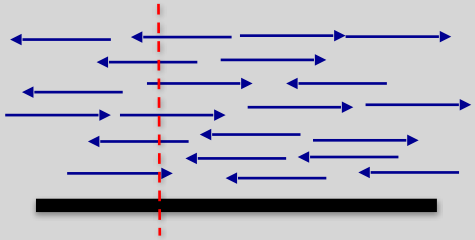
Insert Size

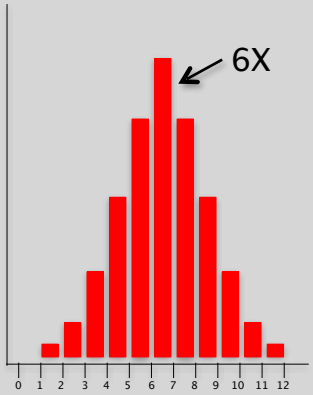




insert size

Sequence Coverage





Base coverage by sequence

Summary: “Generations” of DNA Sequencing

	First generation	Second generation[a]	Third generation[a]
Fundamental technology	Size-separation of specifically end-labeled DNA fragments, produced by SBS or degradation	Wash-and-scan SBS	SBS, by degradation, or direct physical inspection of the DNA molecule
Resolution	Averaged across many copies of the DNA molecule being sequenced	Averaged across many copies of the DNA molecule being sequenced	Single-molecule resolution
Current raw read accuracy	High	High	Moderate
Current read length	Moderate (800–1000 bp)	Short, generally much shorter than Sanger sequencing	Long, 1000 bp and longer in commercial systems
Current throughput	Low	High	Moderate
Current cost	High cost per base Low cost per run	Low cost per base High cost per run	Low-to-moderate cost per base Low cost per run
RNA-sequencing method	cDNA sequencing	cDNA sequencing	Direct RNA sequencing and cDNA sequencing
Time from start of sequencing reaction to result	Hours	Days	Hours
Sample preparation	Moderately complex, PCR amplification not required	Complex, PCR amplification required	Ranges from complex to very simple depending on technology
Data analysis	Routine	Complex because of large data volumes and because short reads complicate assembly and alignment algorithms	Complex because of large data volumes and because technologies yield new types of information and new signal processing challenges
Primary results	Base calls with quality values	Base calls with quality values	Base calls with quality values, potentially other base information such as kinetics

Schadt, EE et al (2010), *Hum. Mol. Biol.*, 19(RI2), pp. R227-R240

Third Generation Sequencing

- Currently in active development
- Hard to define what "3rd" generation means
- Typical characteristics:
  - Long (1,000bp+) sequence reads
  - Single molecule (no amplification step)
  - Often associated with nanopore technology
    - But not necessarily!

The first direct RNA sequencing by nanopore

Side-Note:

- For example this new nanopore sequencing method was just published**!**

  https://www.nature.com/articles/nmeth.4577

- "Sequencing the RNA in a biological sample can unlock a wealth of information, including the identity of bacteria and viruses, the nuances of alternative splicing or the transcriptional state of organisms. However, current methods have limitations due to short read lengths and reverse transcription or amplification biases. Here we demonstrate nanopore direct RNA-seq, a highly parallel, real-time, single-molecule method that circumvents reverse transcription or amplification steps."

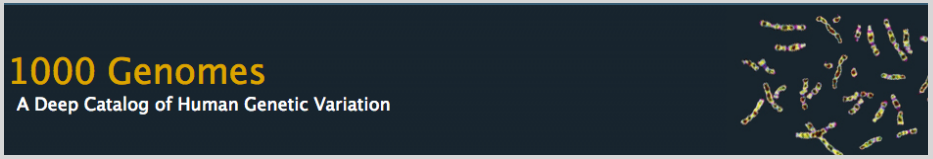
Name	Summary	Bio Tags	Meth Tags	Features	Language	Licence	OS
4peaks	Allows viewing sequencing trace files, motif searching trimming, BLAST and exporting sequences.	Sequencing	Sequence analysis			Freeware	Mac OS X
AB Large Indel Tool	Identifies deviations in clone insert size that indicate intra-chromosomal structural variations compared to a reference genome.	InDel discovery Sequencing	Mapping		Perl	GPL	Linux 64
AB Small Indel Tool	The SOLiD™ Small Indel Tool processes the indel evidences found in the pairing step of the SOLiD™ System Analysis Pipeline Tool (Corona Lite).	InDel discovery Sequencing	Mapping Alignment		Perl C++	GPL	Linux 64
ABBA	Assembly Boosted By Amino acid sequence is a comparative gene assembler, which uses amino acid sequences from predicted proteins to help build a better assembly	Genomic Assembly	Assembly Scaffolding			Artistic License	Linux
ABMapper	Maps RNA-Seq reads to target genome considering possible multiple mapping locations and splice junctions	Genomics Transcriptomics	Mapping Alignment		C++ Perl	GPLv3	Linux
ABySS	ABySS is a de novo sequence assembler designed for short reads and large genomes.	De-novo assembly	Assembly De Bruijn graph	MPI OpenMP	C++	Free for academic use	POSIX Linux Mac OS X
Adapter Removal	Removes adaptor fragments from raw short read	General	Adapter Removal	Trimming	Java	Custom Licence	Linux 64

What can we do with all this sequence information?

Population Scale Analysis

We can now begin to assess genetic differences on a very large scale, both as naturally occurring variation in human and non-human populations as well somatically within tumors



https://www.genomicsengland.co.uk/the-100000-genomes-project/

"Variety's the very spice of life"

–William Cowper, 1785

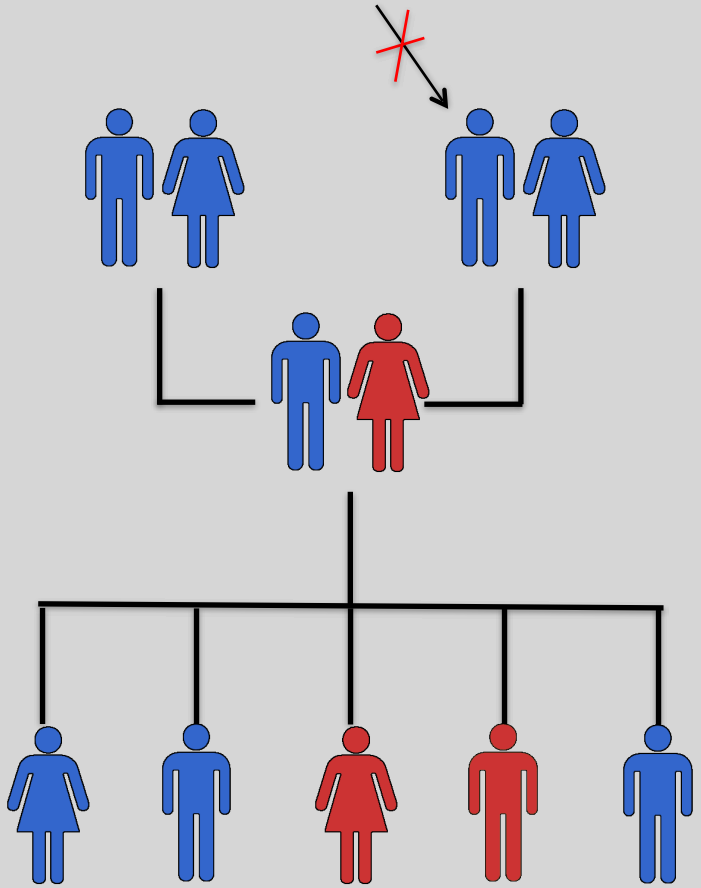
"Variation is the spice of life"

–Kruglyak & Nickerson, 2001

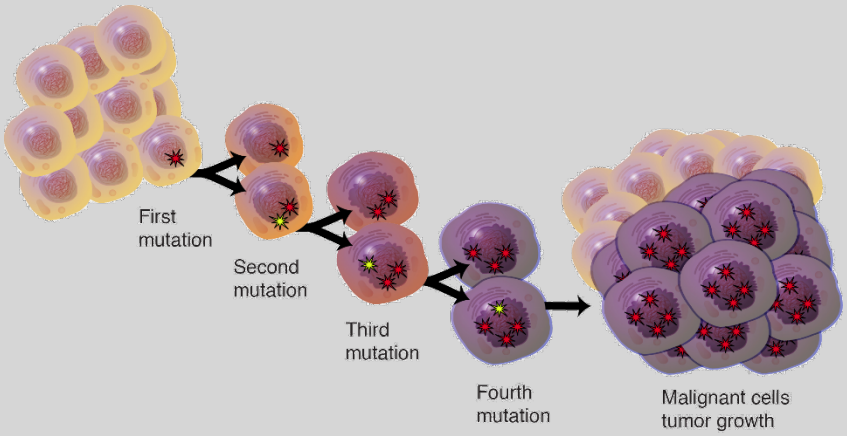
- While the sequencing of the human genome was a great milestone, the DNA from a single person is not representative of the millions of potential differences that can occur between individuals
- These unknown genetic variants could be the cause of many phenotypes such as differing morphology, susceptibility to disease, or be completely benign.

Germline Variation

- Mutations in the germline are passed along to offspring and are present in the DNA over every cell
- In animals, these typically occur in meiosis during gamete differentiation



Somatic Variation

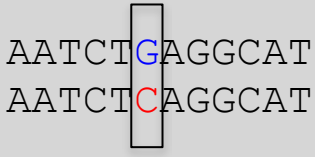


- Mutations in non-germline cells that are not passed along to offspring
- Can occur during mitosis or from the environment itself
- Are an integral part in tumor progression and evolution

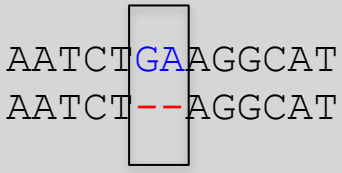
Darryl Leja, Courtesy: National Human Genome Research Institute.

Types of Genomic Variation

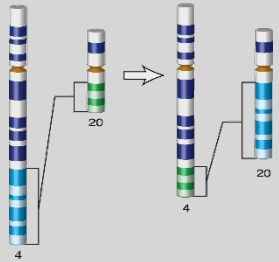
- **Single Nucleotide Polymorphisms** (SNPs) – mutations of one nucleotide to another



- **Insertion/Deletion Polymorphisms** (INDELs) – small mutations removing or adding one or more nucleotides at a particular locus



- **Structural Variation** (SVs) – medium to large sized rearrangements of chromosomal DNA



Darryl Leja, Courtesy: National Human Genome Research Institute.

Differences Between Individuals

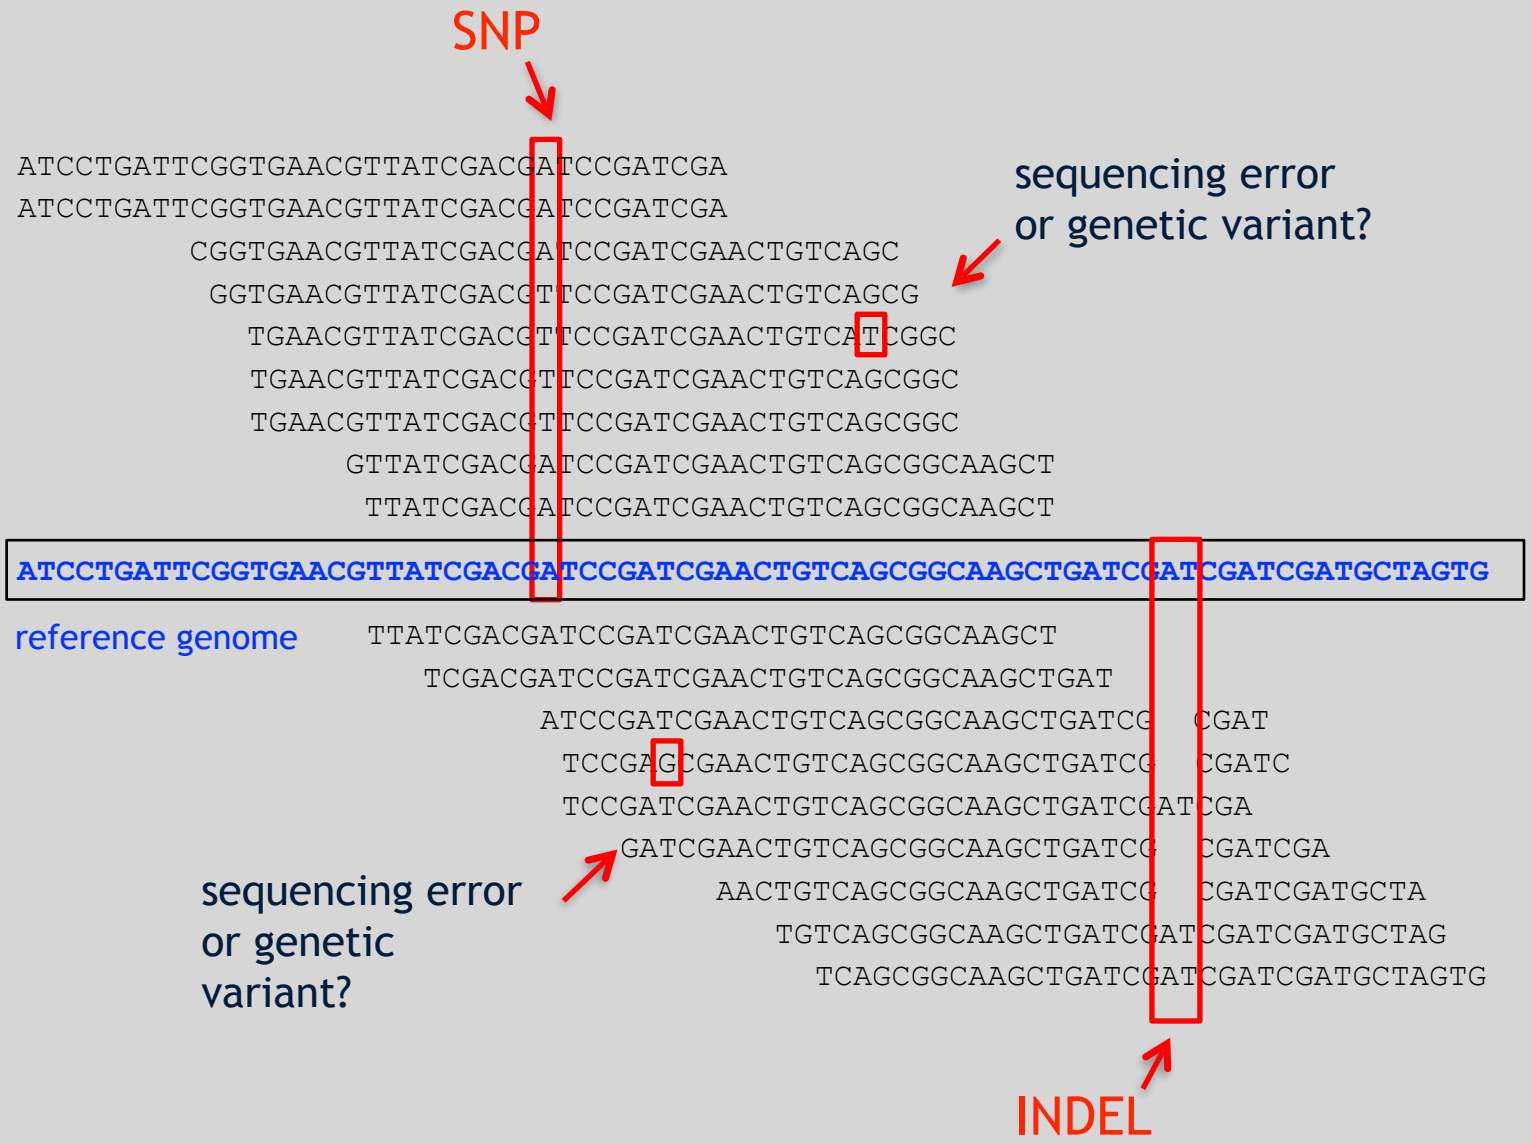
The average number of genetic differences in the germline between two random humans can be broken down as follows:

- 3,600,000 single nucleotide differences
- 344,000 small insertion and deletions
- 1,000 larger deletion and duplications

Numbers change depending on ancestry!

[Numbers from: 1000 Genomes Project, Nature, 2012]

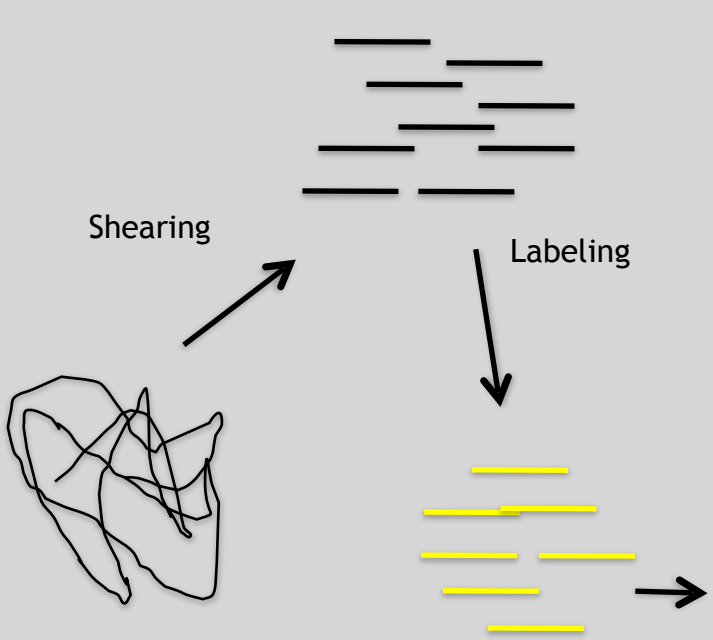
Discovering Variation: SNPs and INDELs

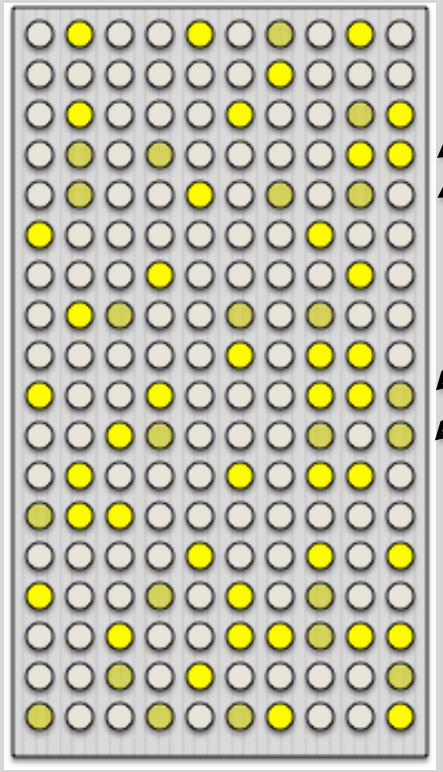


Genotyping Small Variants

- Once discovered, oligonucleotide probes can be generated with each individual allele of a variant of interest
- A large number can then be assessed simultaneously on microarrays to detect which combination of alleles is present in a sample

SNP Microarrays





TAACGATGAATC**T**TAGGCATCGCGC

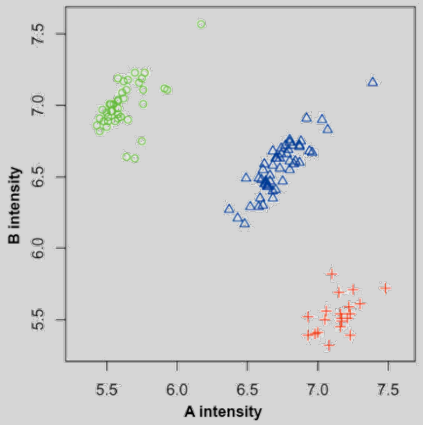
TAACGATGAATC**G**TAGGCATCGCGC

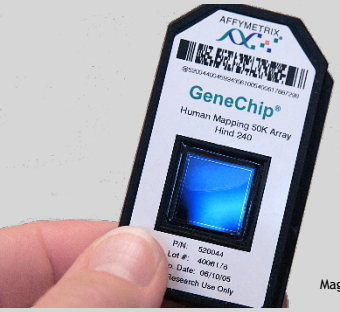
genotype: T/T

GGCTTAAGTACC**C**TATGGATTACGG

GGCTTAAGTACC**T**TATGGATTACGG

genotype: C/T



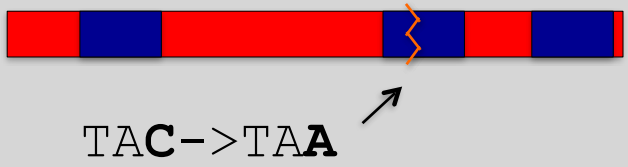


Maggie Bartlett, Courtesy: National Human Genome Research Institute.

Impact of Genetic Variation

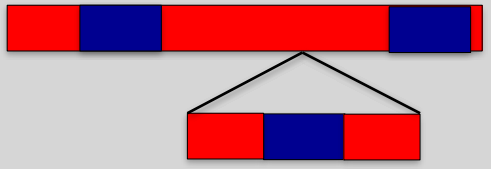
There are numerous ways genetic variation can exhibit functional effects

Premature stop codons

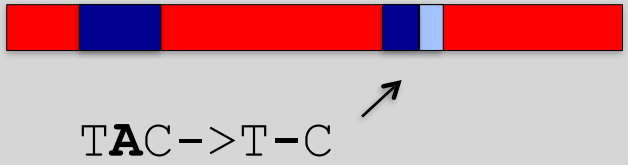


TA**C**->TA**A**

Gene or exon deletion



Frameshift mutation



T**A**C->T-C

Transcription factor binding disruption

ATGCAA**A**T->ATGCA**G**AT

Do it Yourself!

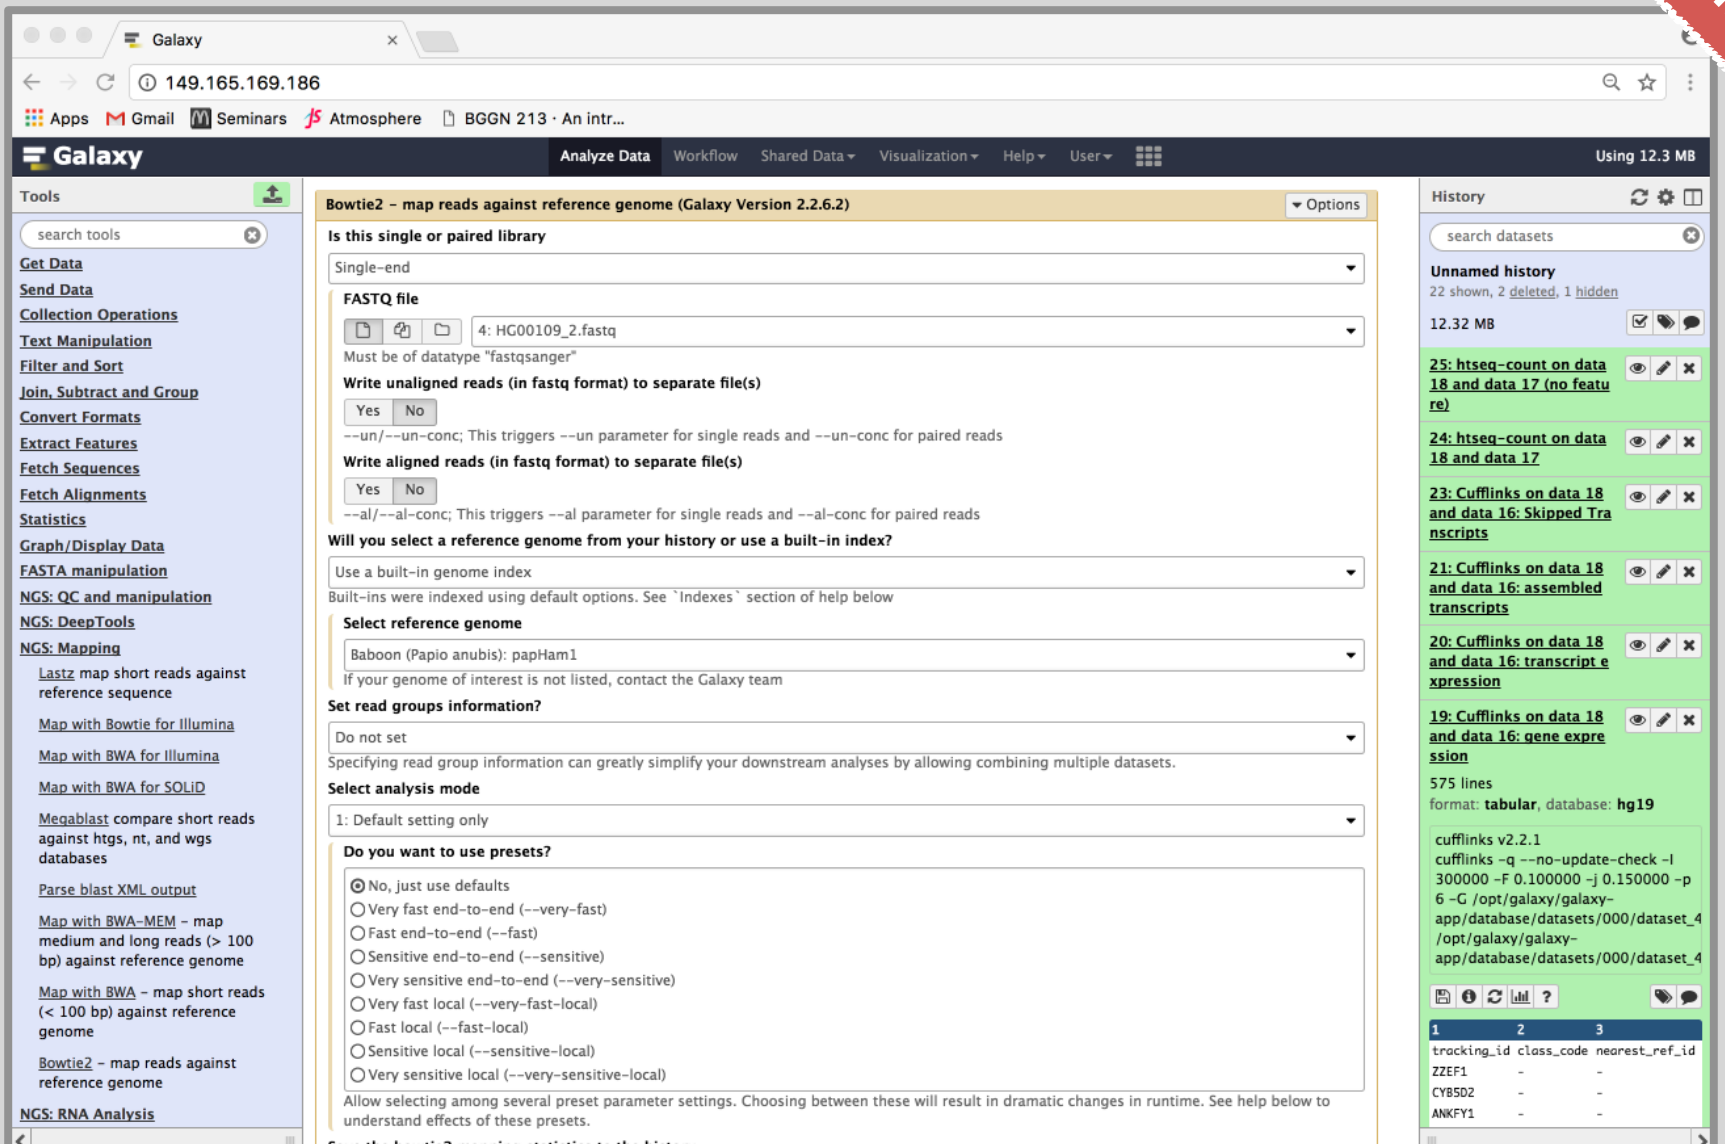
Access a jetstream galaxy instance!

Do it Yourself!

Use assigned IP address



Raw data usually in **FASTQ format**

```
@NS500177:196:HFTTTAFXX:1:11101:10916:1458 2:N:0:CGCGGCTG          1
ACACGACGATGAGGTGACAGTCACGGAGGATAAGATCAATGCCCTCATTAAAGCAGCCGGTGTAA 2
+                                                                  3
AAAAAEEEEEEEEEEE//AEEEAEEEEEEEEEEE/EE/<<EE/AAEEAEE//EEEEAEEEAEA< 4
```

Each sequencing "read" consists of 4 lines of data :

1. The first line (which always starts with '@') is a unique ID for the sequence that follows
2. The second line contains the bases called for the sequenced fragment
3. The third line is always a "+" character
4. The forth line contains the quality scores for each base in the sequenced fragment (these are ASCII encoded…)

ASCII Encoded Base Qualities

```
@NS500177:196:HFTTTAFXX:1:11101:10916:1458 2:N:0:CGCGGCTG
ACACGACGATGAGGTGACAGTCACGGAGGATAAGATCAATGCCCTCATTAAAGCAGCCGGTGTAA
+
AAAAAEEEEEEEEEEE//AEEEAEEEEEEEEEEE/EE/<<EE/AAEEAEE//EEEEAEEEAEA<
```

4

- Each sequence base has a corresponding numeric quality score encoded by a single ASCII character typically on the 4th line (see 4 above)
- ASCII characters represent integers between 0 and 127
- Printable ASCII characters range from 33 to 126
- Unfortunately there are 3 quality score formats that you may come across…

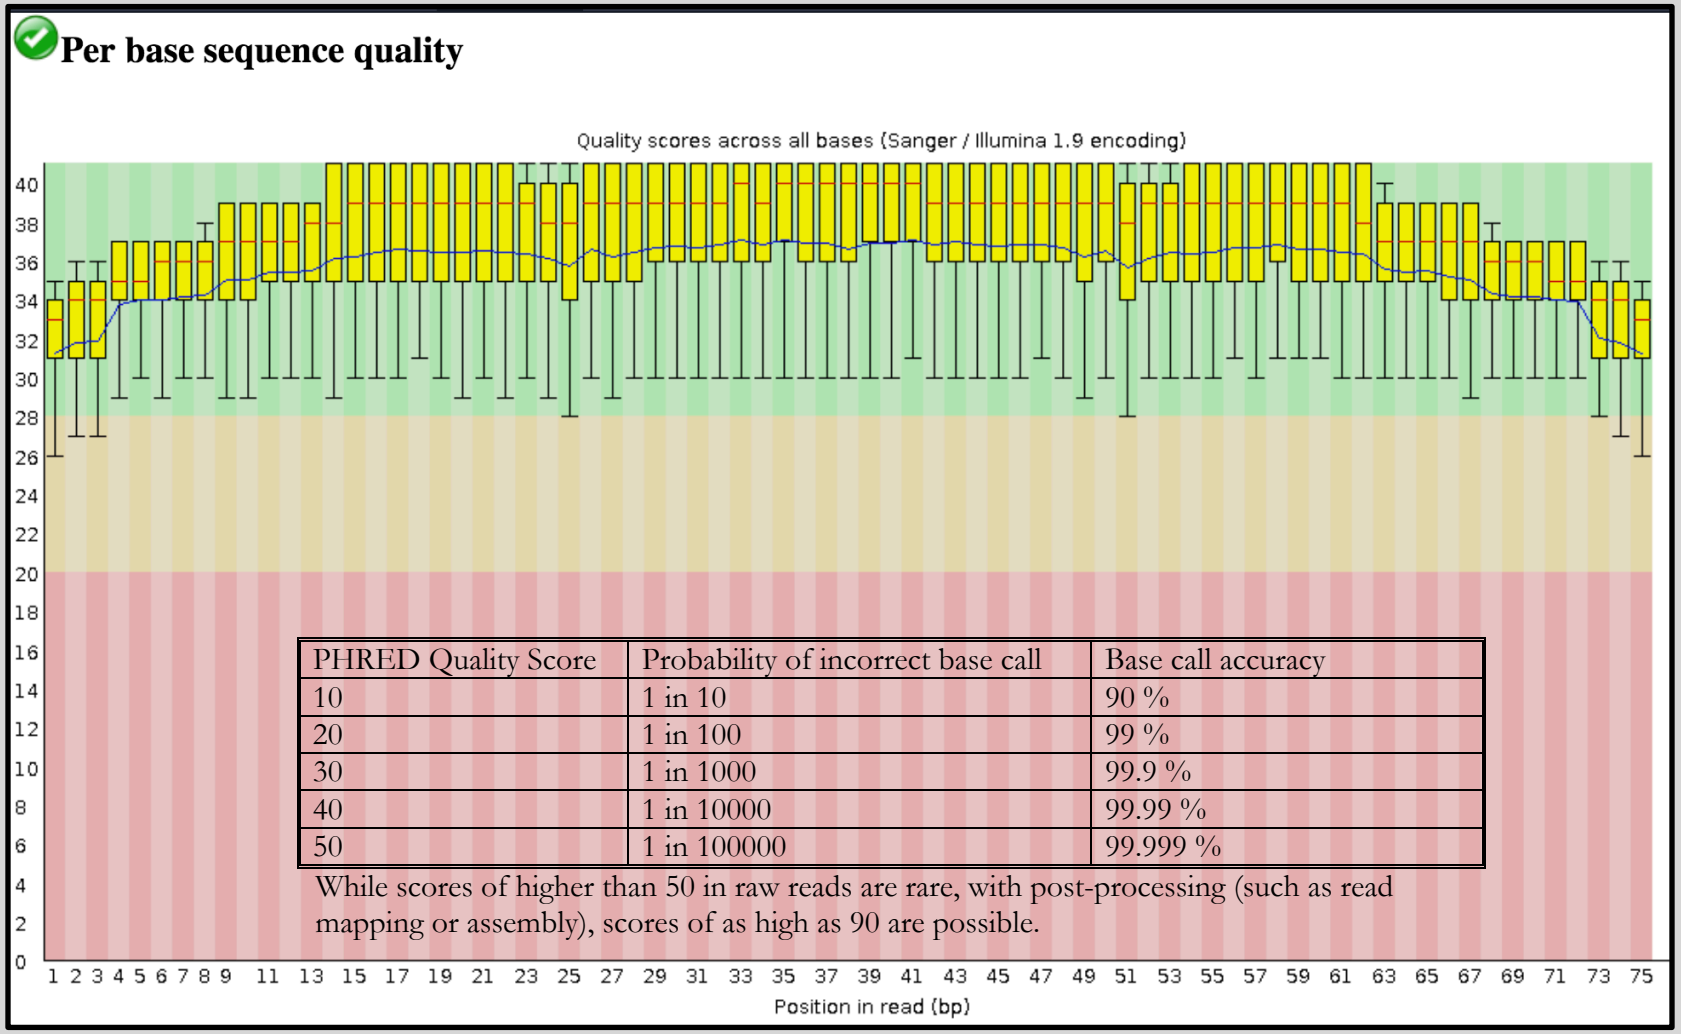
Interpreting Base Qualities in R

		ASCII Range	Offset	Score Range
Sanger, Illumina (Ver > 1.8)	**fastqsanger**	**33-126**	**33**	**0-93**
Solexa, Ilumina (Ver < 1.3)	fastqsolexa	59-126	64	5-62
Illumina (Ver 1.3 -1.7)	fastqillumina	64-126	64	0-62

```
> library(seqinr)
> library(gtools)
> phred <- asc( s2c("DDDDCDEDCDDDDBBDDDCC@") ) - 33
> phred
##  D  D  D  D  C  D  E  D  C  D  D  D  D  B  B  D  D  D  C  C  @
## 35 35 35 35 34 35 36 35 34 35 35 35 35 33 33 35 35 35 34 34 31

> prob <- 10**(-phred/10)
```

FastQC Report



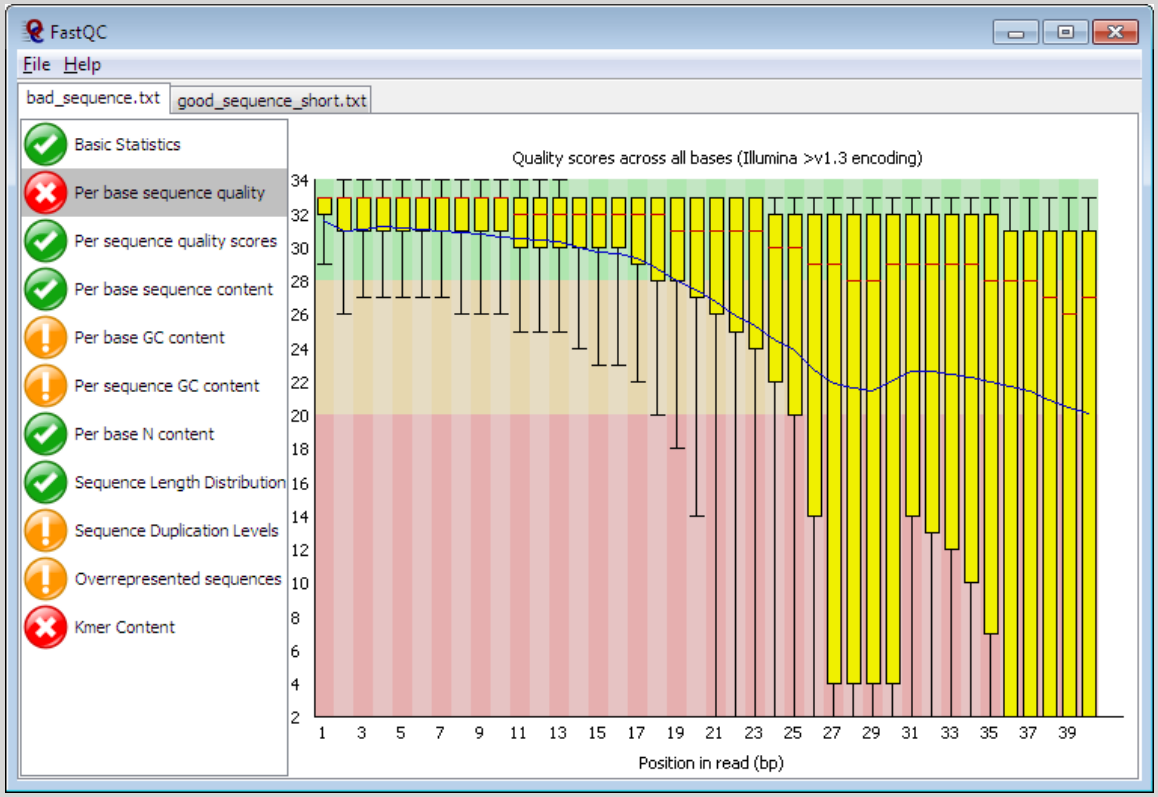
PHRED Quality Score	Probability of incorrect base call	Base call accuracy
10	1 in 10	90 %
20	1 in 100	99 %
30	1 in 1000	99.9 %
40	1 in 10000	99.99 %
50	1 in 100000	99.999 %

While scores of higher than 50 in raw reads are rare, with post-processing (such as read mapping or assembly), scores of as high as 90 are possible.

FASTQC

FASTQC is one approach which provides a visual interpretation of the raw sequence reads

- http://www.bioinformatics.babraham.ac.uk/projects/fastqc/



Sequence Alignment

- Once sequence quality has been assessed, the next step is to align the sequence to a reference genome
- There are *many* distinct tools for doing this; which one you choose is often a reflection of your specific experiment and personal preference

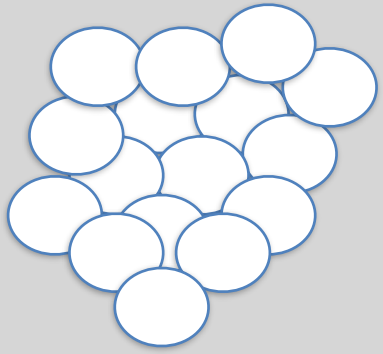
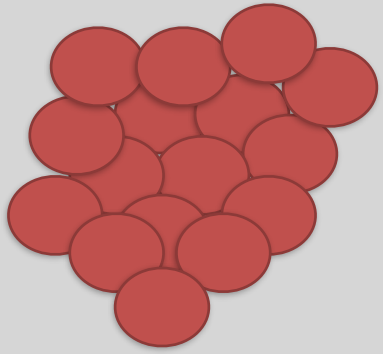
RNA Sequencing

The absolute basics

Normal Cells

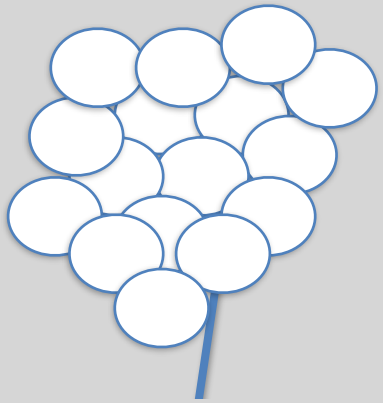


Mutated Cells

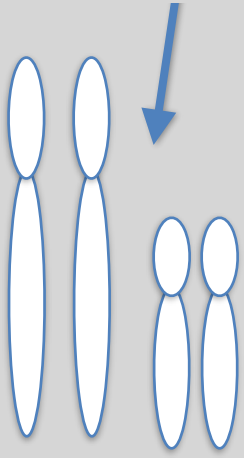


- The mutated cells behave differently than the normal cells
- We want to know what genetic mechanism is causing the difference
- One way to address this is to examine differences in gene expression via RNA sequencing…

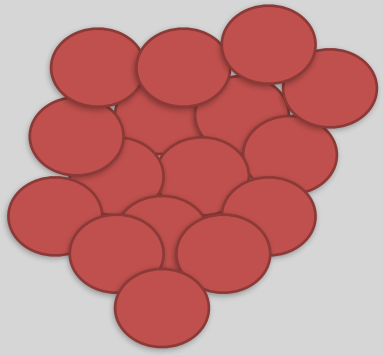
Normal Cells

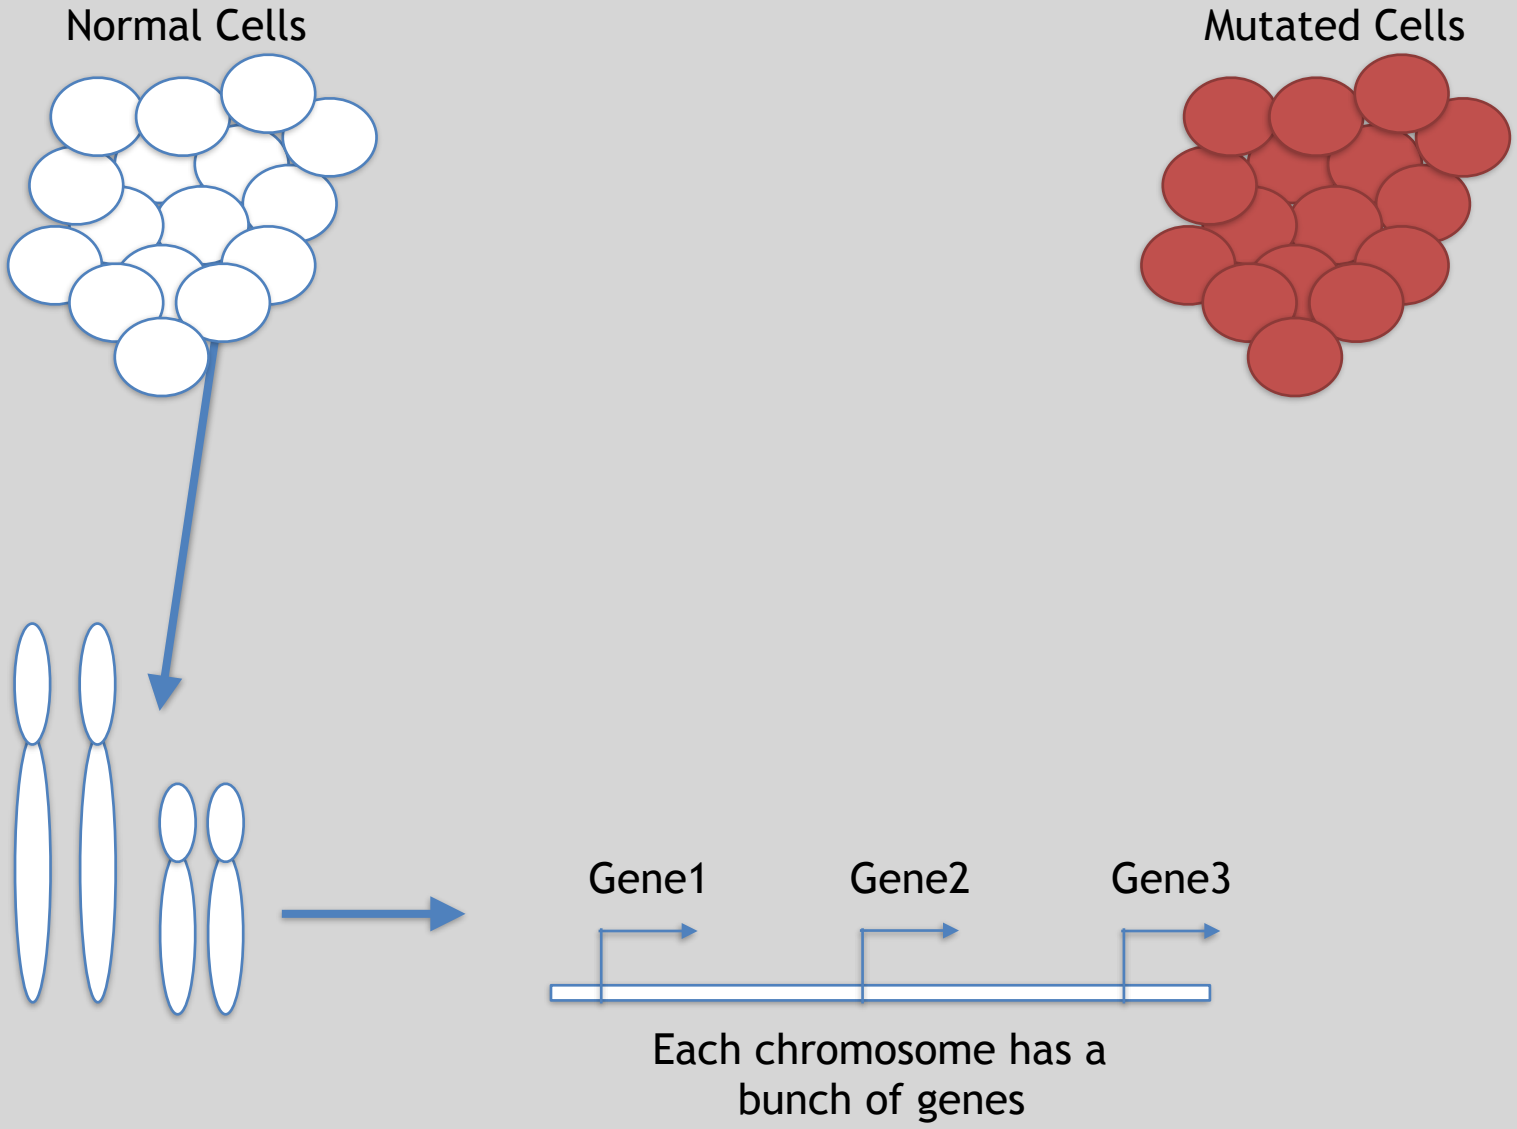


Each cell has a bunch of chromosomes

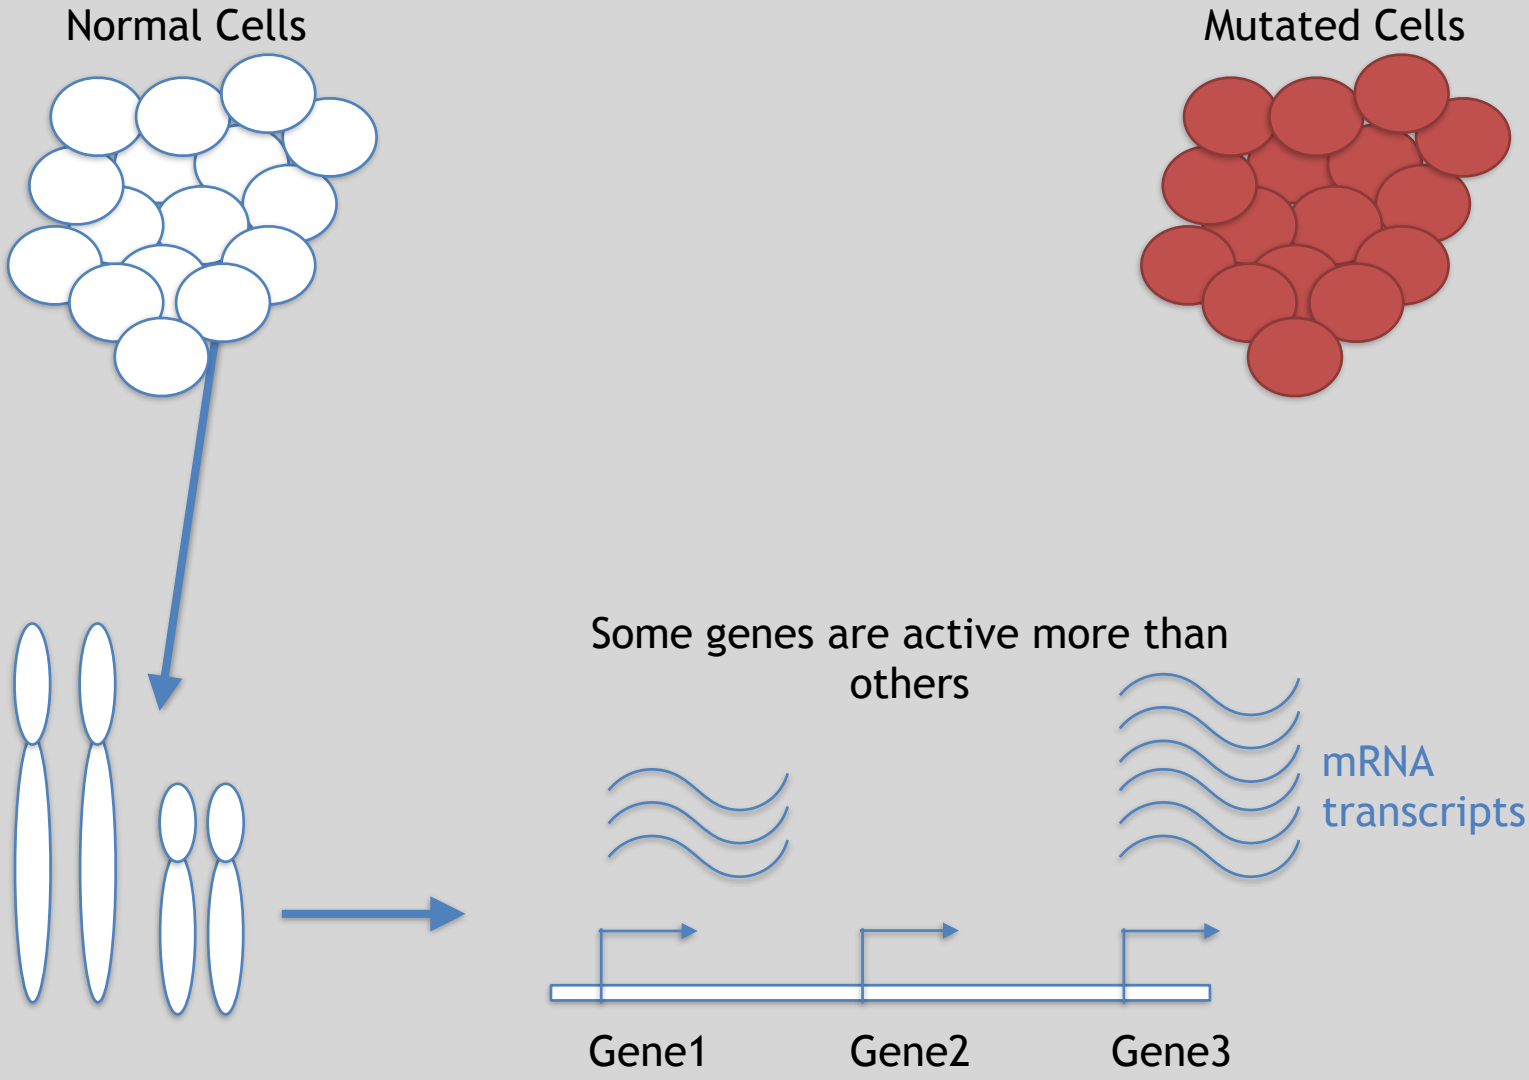


Mutated Cells

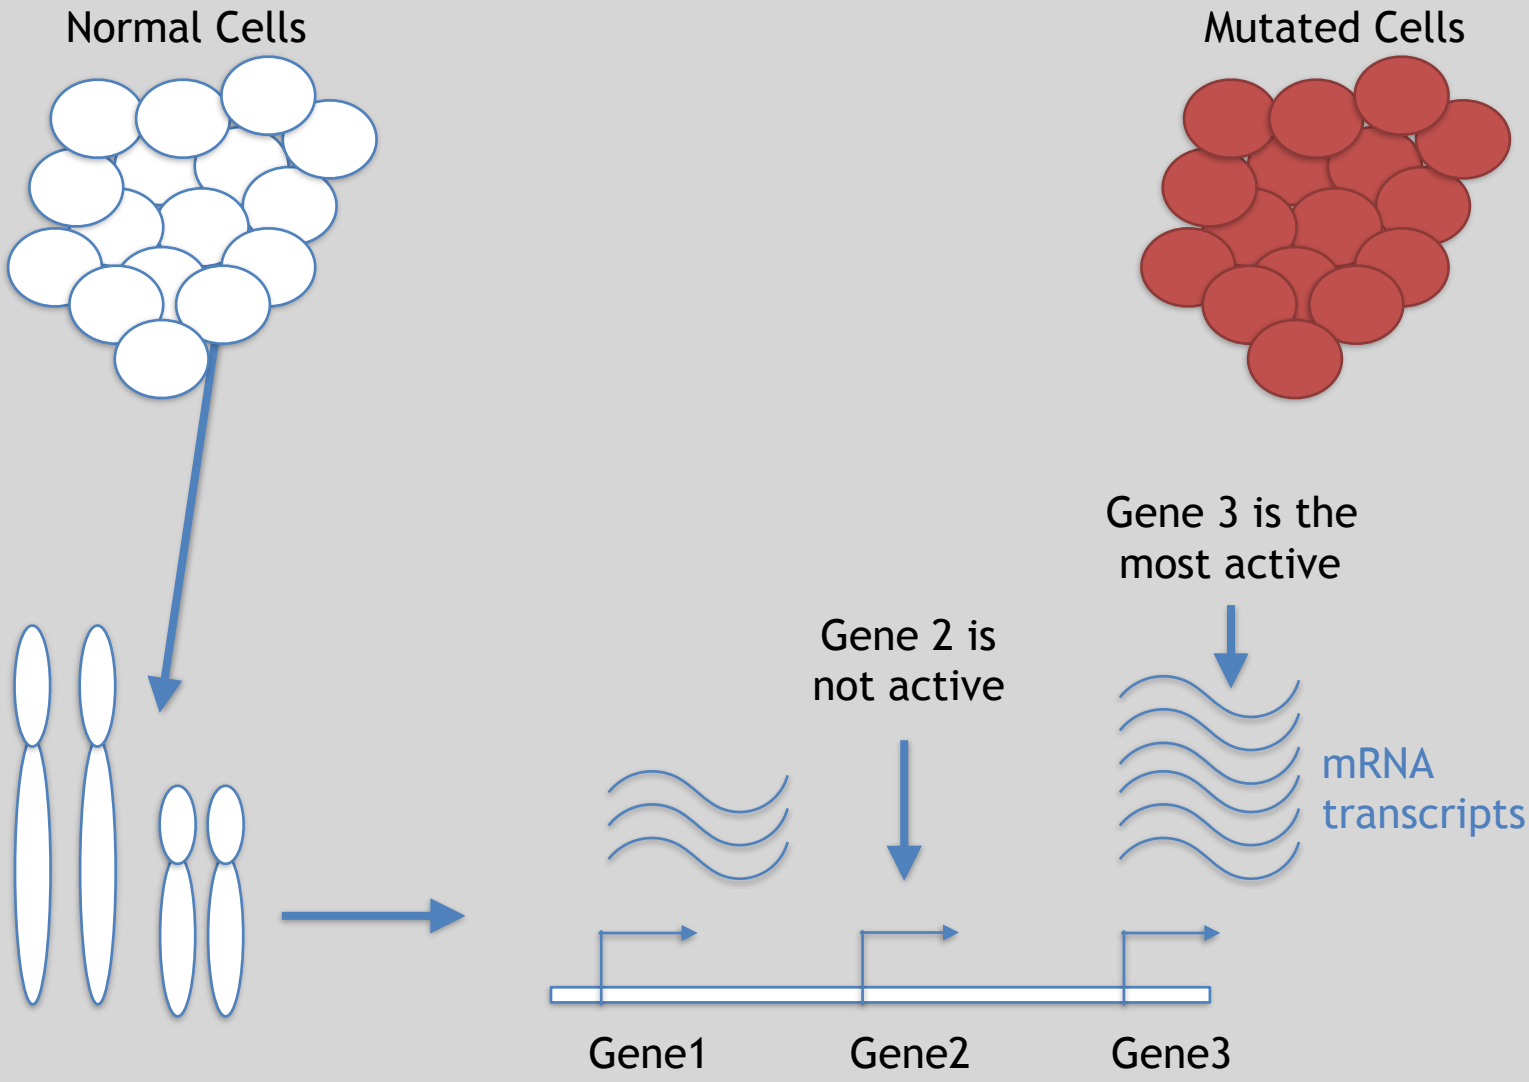




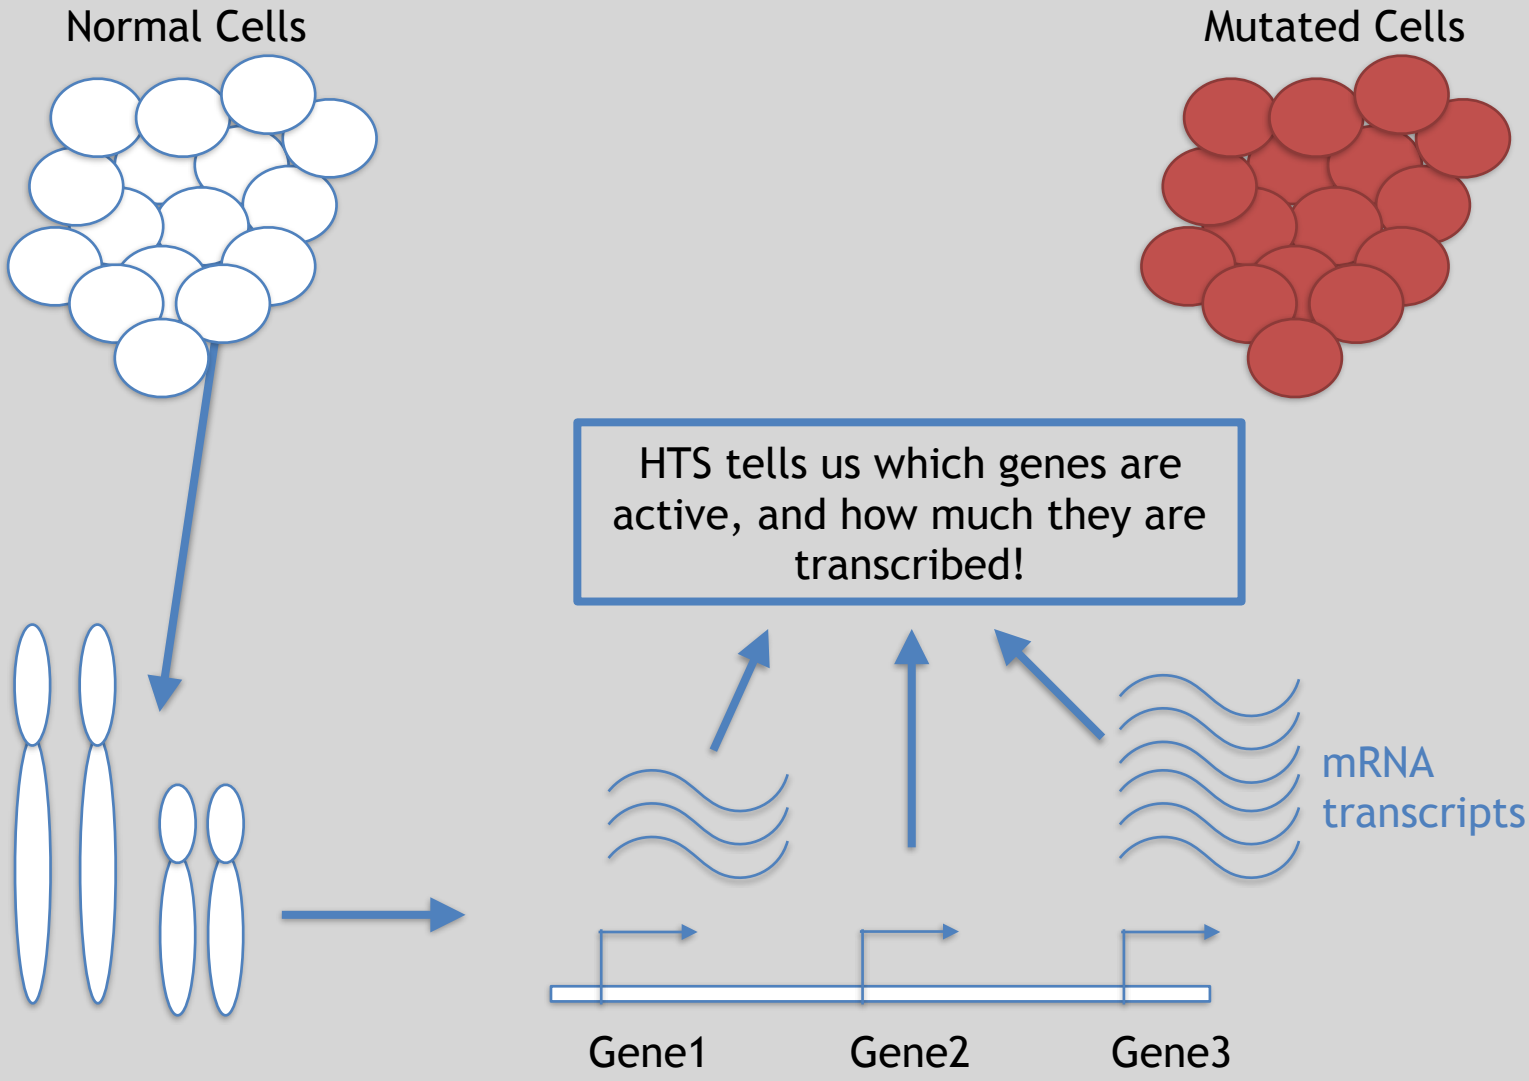
Normal Cells
Mutated Cells
Gene1
Gene2
Gene3
Each chromosome has a
bunch of genes



Normal Cells
Mutated Cells
Some genes are active more than others
mRNA transcripts
Gene1
Gene2
Gene3

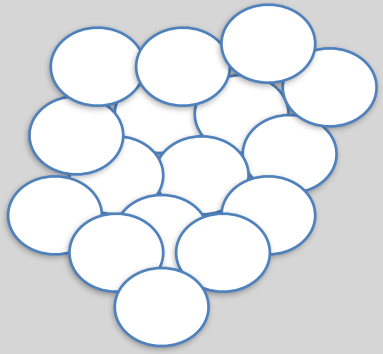


Normal Cells
Mutated Cells
Gene 3 is the most active
Gene 2 is not active
mRNA transcripts
Gene1
Gene2
Gene3

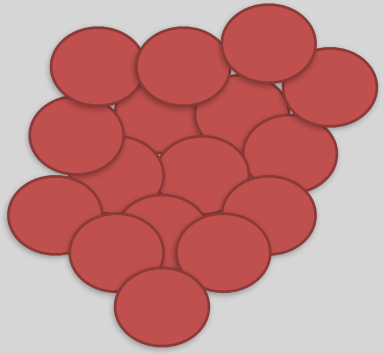


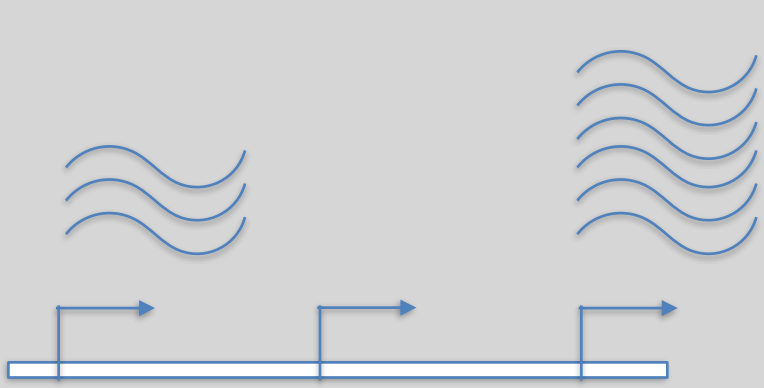
Normal Cells
Mutated Cells
HTS tells us which genes are active, and how much they are transcribed!
mRNA transcripts
Gene1
Gene2
Gene3

Normal Cells

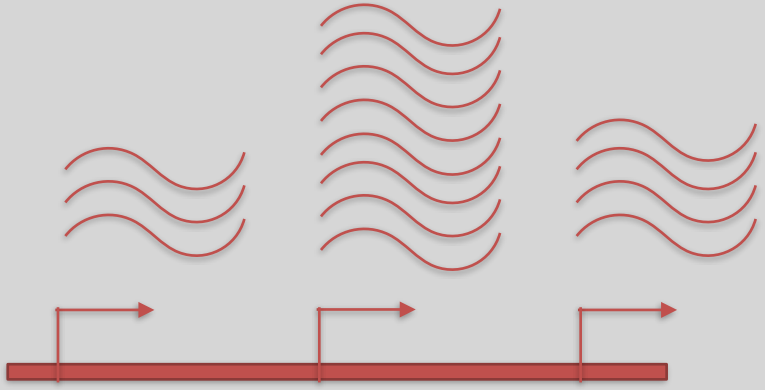


Mutated Cells



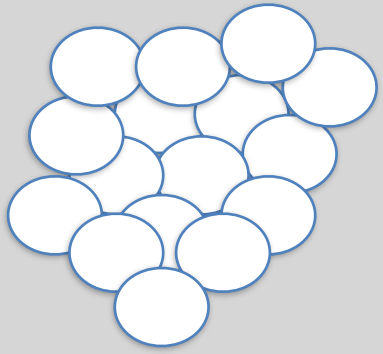


We use RNA-Seq to measure gene expression in normal cells …

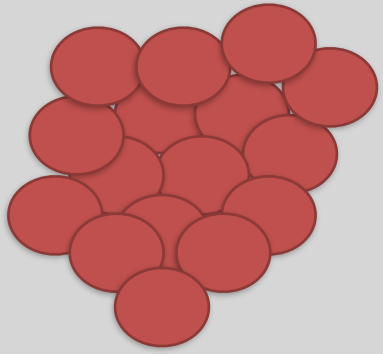


… then use it to measure gene expression in mutated cells

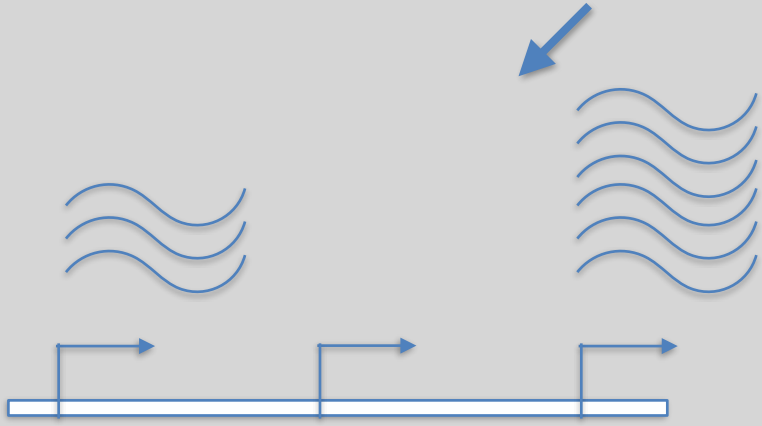
Normal Cells

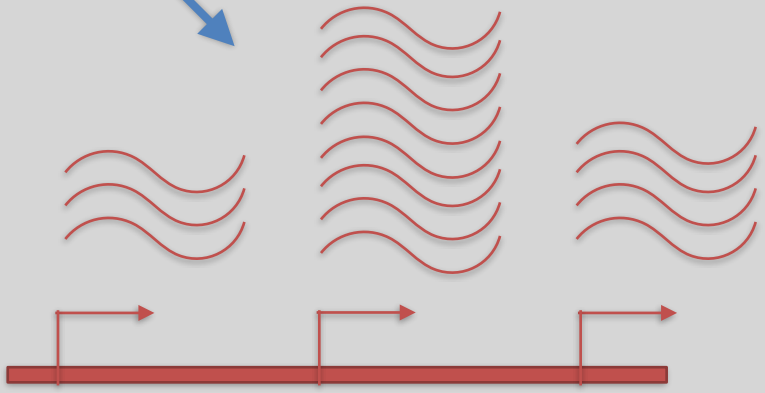


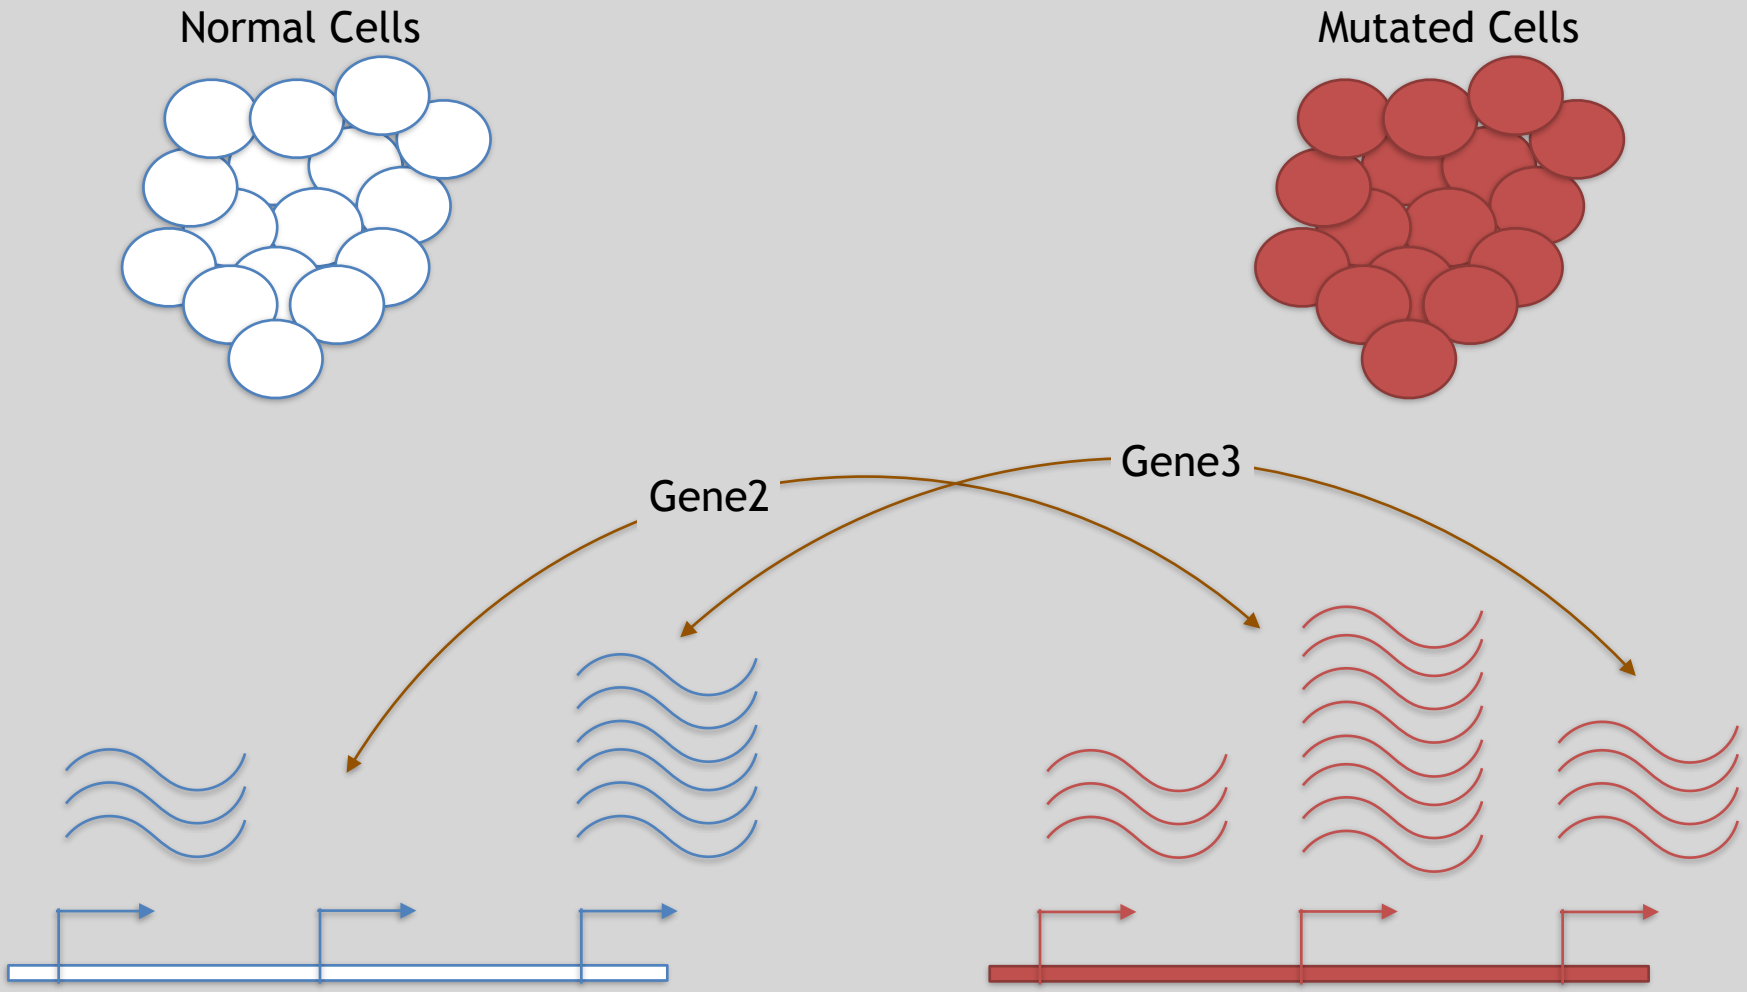
Mutated Cells



Then we can compare the two cell types to figure out what is different in the mutated cells!







Differences apparent for Gene 2 and
to a lesser extent Gene 3

3 Main Steps for RNA-Seq:

1) **Prepare a sequencing library**
   (RNA to cDNA conversion via reverse transcription)

2) **Sequence**
   (Using the same technologies as DNA sequencing)

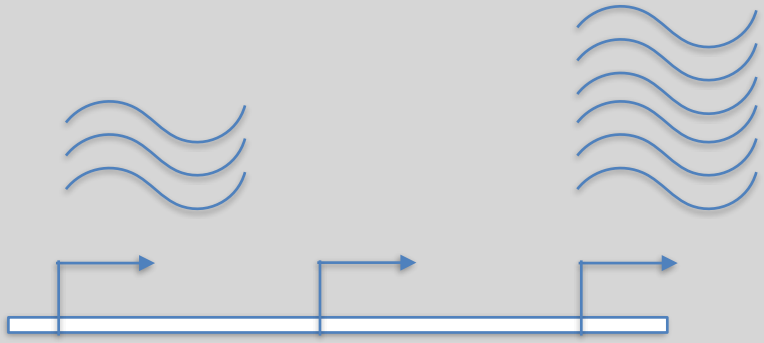
3) **Data analysis**
   (Often the major bottleneck to overall success!)

We will discuss each of these steps in detail (particularly the 3rd) next day!

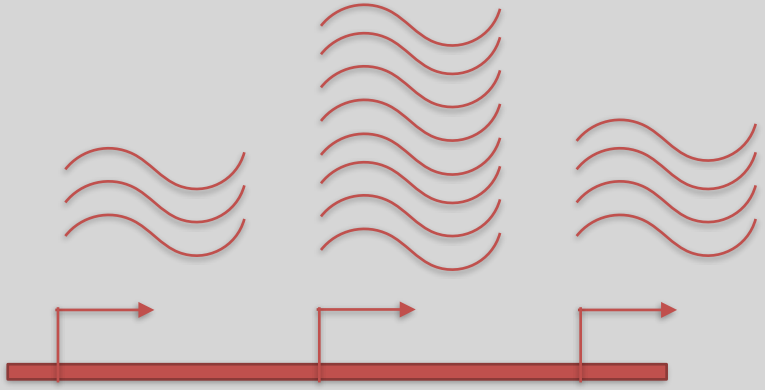
Today we will get to the start of step 3!

Gene	WT-1	WT-2	WT-3	…
A1BG	30	5	13	…
AS1	24	10	18	…
…	…	…	…	…

We **sequenced**, **aligned**, **counted** the reads per gene in each sample to arrive at our data matrix



Normal Cells



Mutated Cells

SAM Format

Reference

- **S**equence **A**lignment/**M**ap (**SAM**) format is the almost-universal sequence alignment format for NGS
  - binary version is BAM
- It consists of a header section (lines start with '@') and an alignment section
- The official specification can be found here:
  - http://samtools.sourceforge.net/SAM1.pdf

Example SAM File

Reference

- Because SAM files are plain text (unlike their binary counterpart, BAM), we can take a peek at a few lines of the header with head, See:

https://bioboot.github.io/bimm143_F18/class-material/sam_format/

Header section

```

```

SAM header section

Reference

- Header lines contain vital metadata about the reference sequences, read and sample information, and (optionally) processing steps and comments.

- Each header line begins with an **@**, followed by a two-letter code that distinguishes the different type of metadata records in the header.

- Following this two-letter code are tab-delimited key-value pairs in the format **KEY:VALUE** (the SAM format specification names these tags and values).

https://bioboot.github.io/bimm143_F18/class-material/sam_format/

SAM Utilities

Reference

- **Samtools** is a common toolkit for analyzing and manipulating files in SAM/BAM format
  - http://samtools.sourceforge.net/
- **Picard** is a another set of utilities that can used to manipulate and modify SAM files
  - http://picard.sourceforge.net/
- These can be used for viewing, parsing, sorting, and filtering SAM files as well as adding new information (e.g. Read Groups)
