Schedule - BIMM 143

UC San Diego

BIMM 143
 A hands-on introduction to the computer-based analysis of genomic and biomolecular data from the Division of Biological Sciences, UCSD.

Overview
 Schedule
 Computer Setup
 Learning Goals

Home	Mail	Cal	GSHub	BIMM143	BIOIN213	GDVis	Atmosphere	CloudLaunch	BIMM104	BIOL	News
		09/30/21		Needleman-Wunsch, Smith-Waterman and BLAST heuristic approaches, Hands on with dot plots, Needleman-Wunsch and BLAST algorithms highlighting their utility and limitations.							
		Tue 10/05/21		Project: Find a gene project assignment (Part 1) Principles of database searching, due in 2 weeks. (Part 2) Sequence analysis, structure analysis and general data analysis with R due at the end of the quarter.							
		Tue 10/05/21		Optional: Advanced sequence alignment and database searching Detecting remote sequence similarity, Database searching beyond BLAST, Substitution matrices, Using PSI-BLAST, Profiles and HMMs, Protein structure comparisons as a gold standard.							
		Thu 10/07/21		Bioinformatics data analysis with R Why do we use R for bioinformatics? R language basics and the RStudio IDE, Major R data structures and functions, Using R interactively from the RStudio console. Introducing Rmarkdown documents.							

[Data exploration and visualization in R](#)

Find-a-Gene Project Assignment

- A total of 20% of the course grade will be assigned based on the ["find-a-gene project assignment"](#)

Find-a-Gene Project Assignment

- A total of 20% of the course grade will be assigned based on the ["find-a-gene project assignment"](#)
- The objective with this assignment is for you to demonstrate your grasp of database searching, sequence analysis, structure analysis and the R environment that we have covered to date in class.

Find-a-Gene Project Assignment

- A total of 20% of the course grade will be assigned based on the “[find-a-gene project assignment](#)”
- The objective with this assignment is for you to demonstrate your grasp of database searching, sequence analysis, structure analysis and the R environment that we have covered to date in class.
- You may wish to consult the scoring rubric (in the linked project description) and the [example report](#) for format and content guidance.

Find-a-Gene Project Assignment

- A total of 20% of the course grade will be assigned based on the “[find-a-gene project assignment](#)”
- The objective with this assignment is for you to demonstrate your grasp of database searching, sequence analysis, structure analysis and the R environment that we have covered to date in class.
- You may wish to consult the scoring rubric (in the linked project description) and the [example report](#) for format and content guidance.
 - Your responses to questions Q1-Q4 are due 12pm San Diego time on Tuesday **Oct 19th** (10/19/21).
 - The complete assignment, including responses to **all questions**, is due 12pm San Diego time on **Dec 2nd** (12/02/21).

Find-a-Gene Project Assignment

- A total of 20% of the course grade will be assigned based on the “[find-a-gene project assignment](#)”
- The objective with this assignment is for you to demonstrate your grasp of database searching, sequence analysis, structure analysis and the R environment that we have covered to date in class.
- You may wish to consult the scoring rubric (in the linked project description) and the [example report](#) for format and content guidance.
 - Your responses to questions Q1-Q4 are due 12pm San Diego time on Tuesday **Oct 19th** (10/19/21).
 - The complete assignment, including responses to **all questions**, is due 12pm San Diego time on **Dec 2nd** (12/02/21).

Questions:

[Q1] Tell me the name of a protein you are interested in. Include the species and the accession number. This can be a human protein or a protein from any other species as long as its function is known.

If you do not have a favorite protein, select human RBP4 or KIF11. Do not use beta globin as this is in the worked example report that I provide you with online.

[Q2] Perform a BLAST search against a DNA database, such as a database consisting of genomic DNA or ESTs. The BLAST server can be at NCBI or elsewhere. Include details of the BLAST method used, database searched and any limits applied (e.g. Organism).

Also include the output of that BLAST search in your document. If appropriate, change the font to `courier size 10` so that the results are displayed neatly. You can also screen capture a BLAST output (e.g. all print screen on a PC or on a MAC press `⌘-shift-4`. The pointer becomes a bulls-eye. Select the area you wish to capture and release. The image is saved as a file called `screen_shot_1.png` in your Desktop directory. It is **not** necessary to print out all of the blast results if there are many pages.

On the BLAST results, clearly indicate a match that represents a protein sequence, encoded from some DNA sequence, that is homologous to your query protein. I need to be able to inspect the pairwise alignment you have selected, including the E value and score. It should be labeled a “genomic clone” or “mRNA sequence”, etc. – but include no functional annotation.

In general, [Q2] is the most difficult for students because it requires you to have a “feel” for how to interpret BLAST results. You need to distinguish between a perfect match to your query (i.e. a sequence that is not “novel”), a near match (something that might be “novel”, depending on the results of [Q4]), and a non-homologous result.

If you are having trouble finding a novel gene try restricting your search to an organism that is poorly annotated.

[Q3] Gather information about this “novel” protein. At a minimum, show me the protein sequence of the “novel” protein as displayed in your BLAST results from [Q2] as FASTA format (you can copy and paste the aligned sequence subject lines from your BLAST result page if necessary) or translate your novel DNA sequence using a tool called EMBOSS: Transeq at the EBI. Don’t forget to translate all six reading frames: the ORF (open reading frame) is likely to be the longest sequence without a stop codon. It may not start with a methionine if you don’t have the complete coding region. Make sure the sequence you provide includes a header/subject line and is in traditional FASTA format.

Here, tell me the name of the novel protein, and the species from which it derives. It is very unlikely (but still definitely possible) that you will find a novel gene from an organism such as *S. cerevisiae*, human or mouse, because those genomes have already been thoroughly annotated. It is more likely that you will discover a new gene in a genome that is currently being sequenced, such as bacteria or plants or protozoa.

[Q4] Prove that this gene, and its corresponding protein, are novel. For the purposes of this project, “novel” is defined as follows. Take the protein sequence (your answer to [Q3]), and use it as a query in a blastp search of the nr database at NCBI.

- If there is a match with 100% amino acid identity to a protein in the database, from the same species, then your protein is NOT novel (even if the match is to a protein with a name such as “unknown”). Someone has already found and annotated this sequence, and assigned it an accession number.
- If the top match reported has less than 100% identity, then it is likely that your protein is novel, and you have succeeded.
- If there is a match with 100% identity, but to a different species than the one you started with, then you have likely succeeded in finding a novel gene.
- If there are no database matches to the original query from [Q1], this indicates that you have partially succeeded: yes, you may have found a new gene, but no, it is not actually homologous to the original query. You should probably start over.

[Q5] Generate a multiple sequence alignment with your novel protein, your original query protein, and a group of other members of this family from different species. A typical number of proteins to use in a multiple sequence alignment for this assignment purpose is a minimum of 5 and a maximum of 20 - although the exact number is up to you. Include the multiple sequence alignment in your report. Use Courier font with a size appropriate to fit page width.

Side-note: Indicate your sequence in the alignment by choosing an appropriate name for each sequence in the input unaligned sequence file (i.e. edit the sequence file so that the species, or short common, names (rather than accession numbers) display in the output alignment and in the subsequent answers below). The goal in this step is to create an interesting alignment for building a phylogenetic tree that illustrates species divergence.

UC San Diego
BIMM 143
A hands-on introduction to the computer-based analysis of genomic and biomolecular data from the Division of Biological Sciences, UCSD.

3: (Project) Find a Gene Assignment Part 1

The **find-a-gene project** is a required assignment for BIMM-143. The objective with this assignment is for you to demonstrate your grasp of database searching, sequence analysis, structure analysis and the R environment that we have covered to date in class.

You may wish to consult the **scoring rubric** at the end of the above linked project description and the **example report** for format and content guidance.

- Your responses to questions Q1-Q4 are due **Tuesday Oct 19th** (10/19/21) at 12pm San Diego time.
- The complete assignment, including responses to all questions, is due **Thursday Dec 2nd** (12/02/21) at 12pm San Diego time.
- In both instances your PDF format report should be submitted to GradeScope. Late responses will not be accepted under any circumstances.

Videos:

- 3.1 - **Project Introduction** Please note: due dates may differ from those in video.

3: (Project) Find a Gene Assignment Part 1

The **find-a-gene project** is a required assignment for BIMM-143. The objective with this assignment is for you to demonstrate your grasp of database searching, sequence analysis, structure analysis and the R environment that we have covered to date in class.

- Your responses to questions **Q1-Q4** are due 12pm San Diego time on **Tuesday Oct 19th** (11/19/21).
- The complete assignment, including responses to **all questions**, is due 12pm San Diego time on **Friday Dec 2nd** (12/02/21).

Class 3: Hands-on section

<http://thegrantlab.org/bimm143/>

Class 03

UC San Diego
BIMM 143
A hands-on introduction to the computer-based analysis of genomic and biomolecular data from the Division of Biological Sciences, UCSD.

Schedule

Week	Date	Topic
2	09/30/21	Needleman-Wunsch, Smith-Waterman and BLAST heuristic approaches, Hands on with dot plots, Needleman-Wunsch and BLAST algorithms highlighting their utility and limitations.
3	Tue 10/05/21	Project: Find a gene project assignment (Part 1) Principles of database searching, due in 2 weeks. (Part 2) Sequence analysis, structure analysis and general data analysis with R due at the end of the quarter.
	* Tue 10/05/21	Optional: Advanced sequence alignment and database searching Detecting remote sequence similarity, Database searching beyond BLAST, Substitution matrices, Using PSI-BLAST, Profiles and HMMs, Protein structure comparisons as a gold standard.
	Thu 10/07/21	Bioinformatics data analysis with R Why do we use R for bioinformatics? R language basics and the RStudio IDE, Major R data structures and functions, Using R interactively from the RStudio console, Introducing Rmarkdown documents.
4		Data exploration and visualization in R

R Shiny App

Details:

Sequence 1: GATTAC
Sequence 2: GTCCAGGC

Match Score: -4
Mismatch Score: -1
Gap Score: -2

Sequence alignment: G T C G A C G C / G A T T A C . .

	G	T	C	G	A	C	G	C	
G	0	-2	-4	-6	-8	-10	-12	-14	-16
A	-2	1	-1	-3	-5	-7	-9	-11	
T	-4	-1	0	-2	-4	-6	-8	-10	
C	-6	-3	0	-1	-3	-5	-7	-9	
G	-8	-5	-2	-1	-2	-4	-6	-8	
A	-10	-7	-4	-3	-2	-1	-3	-5	
C	-12	-9	-6	-3	-4	-3	0	-2	

Scoring details:
 - Scores from Diagonal cell: -6 + 1 (Due to a match between G & G) = -5
 - Scores from Upper cell: -8 + -2 (The Gap score) = -10
 - Scores from Side cell: -3 + -2 (The Gap score) = -5
 - Winning (max) score is: -5

YOUR TURN!

- There are **four required** and **one optional** hands-on sections including:

- Limits of using BLAST [~10 mins]
- Using PSI-BLAST [~30 mins]
- Examining conservation patterns [~20 mins]
- BREAK [15 mins] —
- [Optional] Using HMMER [~10 mins]
- Divergence of protein sequence and structure [~25 mins]

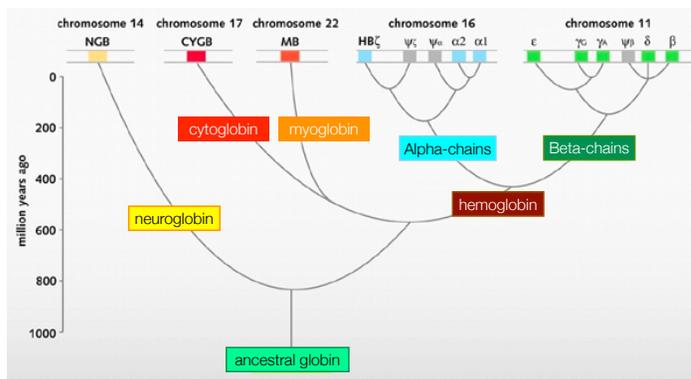

- ▶ Please do answer the last review question (Q20).
- ▶ We encourage discussion at your **Table** and on **Piazza!**

YOUR TURN!

- There are **four required** and **one optional** hands-on sections including:

- ▶ Please do answer the last review question (Q20).
- ▶ We encourage discussion at your **Table** and on **Piazza!**

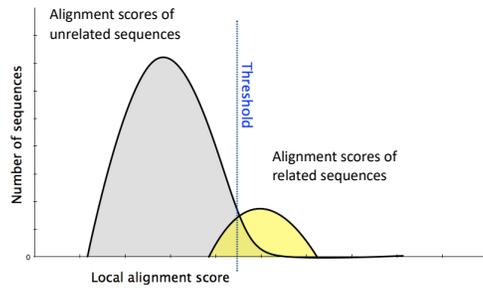

An evolutionary model of human globins.

The different locations of globin genes in human chromosomes are reported at the top of the figure, distinguishing between the functional genes (in color) and the pseudogenes (in grey).

- Ideally, a threshold separates all query related sequences (yellow) from all unrelated sequences (gray)

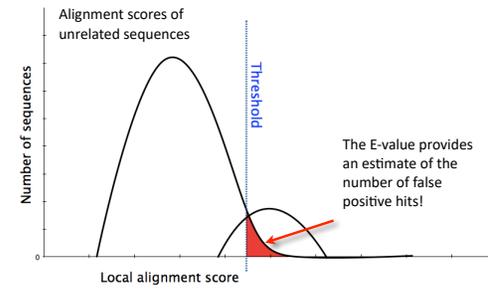

- Unfortunately, often both score distributions overlap
 - The E value describes the expected number of hits with a score above the threshold if the query and database are unrelated

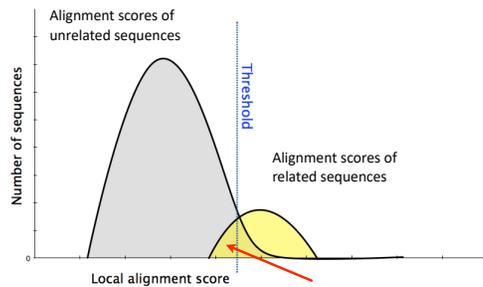

17

- Unfortunately, often both score distributions overlap
 - The E value describes the expected number of hits with a score above the threshold if the query and database are unrelated

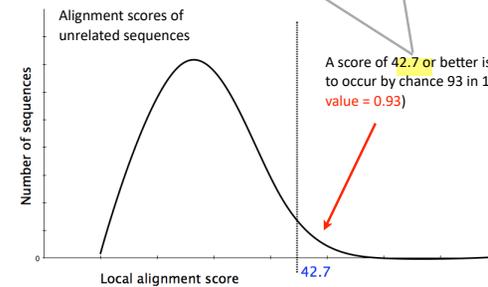

18

- Maybe myoglobin, cytoglobin, neuroglobin etc. are found but not reported because of our E-value cutoff?
 - Lets change the cutoff and see...

19

Description	Max score	Query cover	E value	Max ident	Accession
hemoglobin subunit beta	284	100%	0	100%	NP_000510.1
hemoglobin subunit delta	240	100%	0	75.5%	NP_005321.1
hemoglobin subunit alpha	114	97%	0	43.45%	NP_000508.1
probable ATP-dependent RNA helicase	42.7	10%	0.93	32%	XP_011530405.1

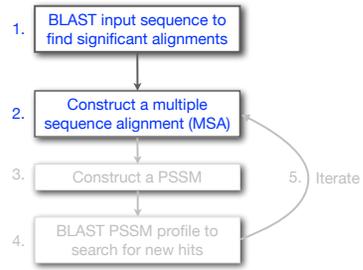

E value: Th alignments with a part

20

PSI-BLAST: Position-Specific Iterated BLAST

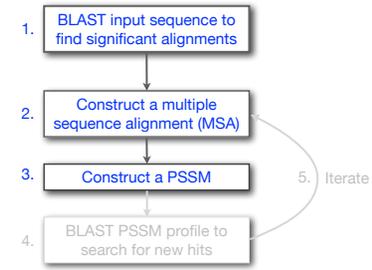

Many proteins in a database are too distantly related to a query to be detected using standard BLAST. In many other cases matches are detected but are so distant that the inference of homology is unclear. Enter the more sensitive PSI-BLAST

(see Altschul *et al.*, Nuc. Acids Res. (1997) 25:3389-3402)

PSI-BLAST: Position-Specific Iterated BLAST

Many proteins in a database are too distantly related to a query to be detected using standard BLAST. In many other cases matches are detected but are so distant that the inference of homology is unclear. Enter the more sensitive PSI-BLAST

(see Altschul *et al.*, Nuc. Acids Res. (1997) 25:3389-3402)

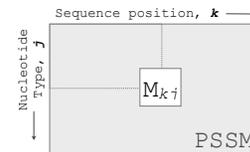

What is a **PSSM**?

What are PSSM sequence profiles?

A sequence profile is a **position-specific scoring matrix** (or **PSSM**, often pronounced 'possum') that gives a *quantitative* description of a set of aligned sequences.

PSSMs assign a score to a query sequence and are widely used for database searching.

A simple PSSM has as many columns as there are positions in the alignment, and either 4 rows (one for each DNA nucleotide) or 20 rows (one for each amino acid).

$$M_{kj} = \log \left(\frac{P_{kj}}{P_j} \right)$$

M_{kj} score for the j th nucleotide at position k
 P_{kj} probability of nucleotide j at position k
 P_j "background" probability of nucleotide j

See Gibskov *et al.* (1987) PNAS 84, 4355

Example: Computing a transcription factor bind site PSSM

Or the "score (M_{kj}) matrix" = PSSM

C_{kj} Number of j th type nucleotide at position k

Z Total number of aligned sequences

p_j "background" probability of nucleotide j

p_{kj} probability of nucleotide j at position k

$$M_{kj} = \log\left(\frac{p_{kj}}{p_j}\right) \quad p_{kj} = \frac{C_{kj} + p_j}{Z + 1}$$

$$M_{kj} = \log\left(\frac{C_{kj} + p_j / Z + 1}{p_j}\right)$$

$$\begin{aligned} \text{Max Score} &= 1.2 + 1.3 + 0.8 + 1.3 + 0.6 + 1.3 + 1.2 \\ &\quad + 0.6 + 1.2 + 0.6 + 1.3 + 1.1 + 1.3 \\ &= 13.8 \end{aligned}$$

A. Following method in Harbison *et al.* (2004) Nature 431:99-104

Heuristic threshold for match = 60% x Max Score = (0.6 x 13.8 = 8.28);
 11.9 > 8.28; Therefore our query is a potential TFBS!

PSI-BLAST: Position-Specific Iterated BLAST

Many proteins in a database are too distantly related to a query to be detected using standard BLAST. In many other cases matches are detected but are so distant that the inference of homology is unclear. Enter the more sensitive PSI-BLAST

(see Altschul *et al.*, Nuc. Acids Res. (1997) 25:3389-3402)

Inspect the blastp output to identify empirical "rules" regarding amino acids tolerated at each position

The PSI-BLAST PSSM is essentially a query customized scoring matrix that is more sensitive than BLOSUM.

Note: A given amino acid (such as alanine) in your query protein can receive different scores for matching alanine depending on the position in the protein (BLOSUM S_{AA} = +4)

Inclusion of irrelevant hits can lead to PSSM corruption

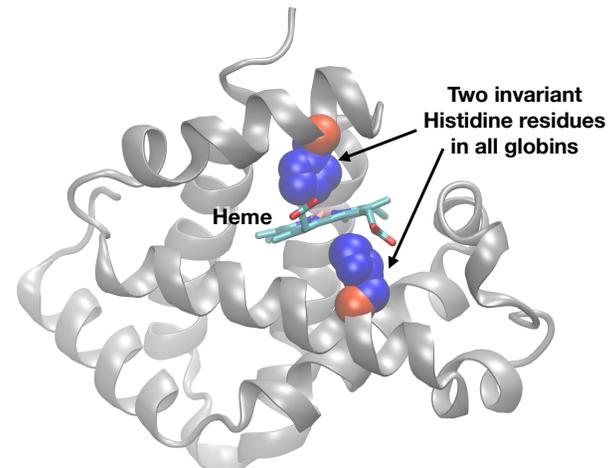

YOUR TURN!

- There are **four required** and **one optional** hands-on sections including:

- Limits of using BLAST [~10 mins]
- Using PSI-BLAST [~30 mins]
- Examining conservation patterns [~20 mins]
— BREAK [15 mins] —
- [Optional] Using HMMER [~10 mins]
- Divergence of protein sequence and structure [~25 mins]

- Please do answer the last review question (Q20).
- We encourage discussion at your **Table** and on **Piazza**!

YOUR TURN!

- There are **four required** and **one optional** hands-on sections including:

- Limits of using BLAST [**~10 mins**]
- Using PSI-BLAST [**~30 mins**]
- Examining conservation patterns [**~20 mins**]
- [Optional] Using HMMER** [**~10 mins**]
- Divergence of protein sequence and structure [**~25 mins**]

— BREAK [15 mins] —

- Please do answer the last review question (**Q20**).
- We encourage discussion at your **Table** and on **Piazza!**

Problems with PSSMs: Positional dependencies

Do not capture positional dependencies

WEIRD
WEIRD
WEIQH
WEIRD
WEIQH

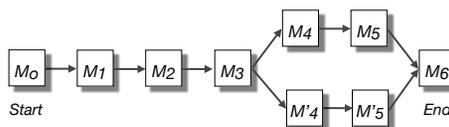

D				0.6
E	I			
H				0.4
I		I		
Q			0.4	
R			0.6	
W	I			

Note: We never see **QD** or **RH**, we only see **RD** and **QH**.
However, $P(RH)=0.24$, $P(QD)=0.24$, while $P(QH)=0.16$

Markov chains: Positional dependencies ✓

The connectivity or **topology** of a Markov chain can easily be designed to capture dependencies and variable length motifs.

WEIRD
WEIRD
WEIQH
WEIRD
WEIQH

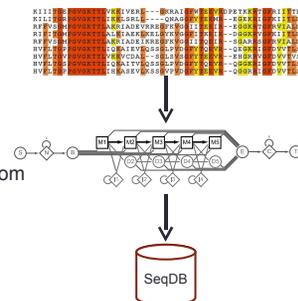

Recall that a PSSM for this motif would give the sequences **WEIRD** and **WEIRH** equally good scores even though the **RH** and **QR** combinations were not observed

Use of HMMER

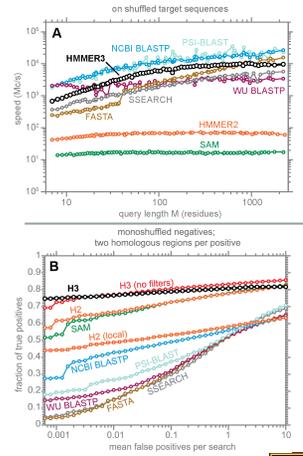

- Widely used by protein family databases

- Use 'seed' alignments
- Until 2010
- Computationally expensive
- Restricted to HMMs constructed from multiple sequence alignments
- Command line application

HMMER vs BLAST

	HMMER	BLAST
Program	<i>PHMMER</i>	<i>BLASTP</i>
Query	Single sequence	
Target Database	Sequence database	
Program	<i>HMMSCAN</i>	<i>RP-BLAST</i>
Query	Single sequence	
Target Database	Profile HMM database, e.g. Pfam	PSSM database, e.g. CDD
Program	<i>HMMSEARCH</i>	<i>PSS-BLAST</i>
Query	Profile HMM	PSSM
Target Database	Sequence database	
Program	<i>JACKHMMER</i>	<i>PSS-BLAST</i>
Query	Single sequence	
Target Database	Sequence database

Summary

- **Find a gene project:** You can start working on this now. Submit your responses to Q1-Q4 to get feedback.
- **PSI-BLAST algorithm:** Application of iterative position specific scoring matrices (PSSMs) to improve BLAST sensitivity
- **Hidden Markov models (HMMs):** More versatile probabilistic model for detection of remote similarities
- **Structure comparisons as gold standards:** Structure is more conserved than sequence

Homework: DataCamp!

Install **R** and **RStudio** (see website)

Complete the **Introduction to R** course on **DataCamp**
(Check Piazza for your DataCamp invite and sign up with your UCSD email (i.e. first part of your email address) please.)

Let me know **NOW** if you don't have access to DataCamp!
